#### **IMPORTANT!**

#### READ CAREFULLY BEFORE USE.

#### KEEP THIS GUIDE FOR FUTURE REFERENCE.

This is a User's Guide for a series of products. Not all products support all firmware features. Screenshots and graphics in this book may differ slightly from your product due to differences in product features or web configurator brand style. Every effort has been made to ensure that the information in this manual is accurate.

#### **Related Documentation**

• Quick Start Guide

The Quick Start Guide shows how to connect the Zyxel Device.

More Information

Go to *https://service-provider.zyxel.com/global/en/tech-support* to find other information on Zyxel Device.

## **Document Conventions**

#### Warnings and Notes

These are how warnings and notes are shown in this guide.

## Warnings tell you about things that could harm you or your Zyxel Device.

Note: Notes tell you other important information (for example, other things you may need to configure or helpful tips) or recommendations.

#### Syntax Conventions

- The NR (5G) or FWA device in this user's guide will be referred to as the "Zyxel Device".
- Product labels, screen names, field labels and field choices are all in **bold** font.
- A right angle bracket ( > ) within a screen name denotes a mouse click. For example, Network Setting > Routing > DNS Route means you first click Network Setting in the navigation panel, then the Routing submenu, and then finally the DNS Route tab to get to that screen.

#### Icons Used in Figures

Figures in this user guide may use the following generic icons. The Zyxel Device icon is not an exact representation of your Zyxel Device.

| Zyxel Device | Generic Router            | Switch             |
|--------------|---------------------------|--------------------|
| Server       | Firewall                  | USB Storage Device |
| Printer      | 4G LTE/5G NR Base Station |                    |

# PART I User's Guide

## CHAPTER 1 Introduction

## 1.1 Overview

The Zyxel Device consists of the following models:

- NR5101
- NR5103
- NR5103E
- FWA510

#### 1.1.1 Model Feature Differences

The Zyxel Device is a router that supports (but not limited to) the following features. Note the following differences between the Zyxel Device models:

| FEATURE/MODEL   | NR5101   | NR5103                | NR5103E               | FWA510                |
|---|----------|-----------------------|-----------------------|-----------------------|
| IEEE 802.11 b/g/n/a/ac/ax WiFi                              | YES      | YES                   | YES                   | YES                   |
| Maximum5G NR Speed  | 2.3 Gbps | 4.7 Gbps              | 4.7 Gbps              | 4.7 Gbps              |
| Maximum4G LTE Speed   | 2 Gbps   | 1.6 Gbps              | 1.6 Gbps              | 1.6 Gbps              |
| Gigabit Ethernet WAN/LAN Port                               | YES      | YES                   | YES                   | YES                   |
| USB Port (For File Sharing)                                 | YES      | YES                   | YES                   | YES                   |
| DHCP (Dynamic Host<br>Configuration Protocol) Server        | YES      | YES                   | YES                   | YES                   |
| NAT (Network Address<br>Translation)                        | YES      | YES                   | YES                   | YES                   |
| DMZ (DeMilitarized Zone)                                    | YES      | YES                   | YES                   | YES                   |
| Cellular PLMN (Public Land<br>Mobile Network) Configuration | YES      | YES                   | YES                   | YES                   |
| Cellular SMS  | YES      | YES                   | YES                   | YES                   |
| ALG (Application Layer<br>Gateway)                          | YES      | NO                    | NO                    | NO                    |
| Security Mode   | WPA2-PSK | WPA3-SAE/<br>WPA2-PSK | WPA3-SAE/<br>WPA2-PSK | WPA3-SAE/<br>WPA2-PSK |
| Policy Route  | YES      | NO                    | NO                    | NO                    |
| Static / Dynamic Route Setting<br>Using RIP                 | YES      | YES                   | YES                   | YES                   |
| Port Forwarding / Port Triggering                           | YES/YES  | YES/NO                | YES/NO                | YES/NO                |
| ARP (Address Resolution<br>Protocol)                        | YES      | YES                   | YES                   | YES                   |

#### Table 1 Model Feature Comparison

| FEATURE/MODEL  | NR5101 | NR5103 | NR5103E | FWA510 |
|--|--------|--------|---------|--------|
| Dynamic DNS  | YES    | NO     | NO      | NO     |
| Parental Control   | YES    | NO     | YES     | NO     |

| EasyMesh Supported Extender                                | NO     | WSM20  | NO      | WSM20  |
| MU-MIMO Technology   | NO     | YES    | NO      | YES    |

#### Table 1 Model Feature Comparison

## 1.2 Applications for the Zyxel Device

#### Wireless WAN

The Zyxel Device can connect to the Internet through a cellular SIM card to access a wireless WAN connection. Just insert a SIM card into the SIM card slot at the bottom of the Zyxel Device.

Note: You must insert the SIM card into the card slot before turning on the Zyxel Device.

Note: You can install external antennas to improve your wireless WAN signal strength.

#### **Internet Access**

Your Zyxel Device provides shared Internet access by connecting to a cellular network. Connect a computer to the Zyxel Device's **LAN** port or wirelessly for Internet access.

Figure 1 Zyxel Device's Internet Access Application

#### Wireless LAN (WiFi)

Wireless clients can connect to the Zyxel Device WiFi network to access network resources. The Zyxel Device supports WiFi Protected Setup (WPS), which allows you to quickly set up a WiFi connection between the Zyxel Device and a WiFi client with strong security.

#### **Carrier Aggregation**

Carrier Aggregation (CA) is a technology to deliver high downlink data rates by combining more than one carrier in the same or different bands together. You can use data rates from Primary Component Carrier (PCC) and Secondary Component Carrier (SCC) of other neighboring base stations. The Secondary Component Carriers can be added or removed as needed to increase/decrease bandwidth.

#### **Ethernet WAN**

If you have another broadband modem or router available, you can use the Ethernet WAN port and then connect it to the broadband modem or router. This way, you can access the Internet through an Ethernet WAN connection.

## 1.3 EasyMesh

An EasyMesh network is composed of three key components.

(A) A router works as a controller to manage and optimize the EasyMesh network.

(B) One or more devices in the EasyMesh network function as APs or WiFi Extenders to extend the WiFi communication range.

(C) Multiple client devices connect to the EasyMesh network for Internet connections.

#### 1.3.1 Network Controller

The Zyxel Device functions as a controller to coordinate and optimize WiFi activity In the EasyMesh network. The controller collects Channel Availability Check responses and scan reports from the APs or WiFi Extenders. Then, the controller selects the best channel and the final optimized topology based on the current situation.

The EasyMesh network uses AP steering and Band steering mechanisms to improve WiFi performance. AP steering allows WiFi clients to roam seamlessly in an EasyMesh network. Band steering allows 2.4 GHz / 5 GHz dual-band WiFi clients to move from one band to another less busy band. For AP steering to work, the controller and the devices in the EasyMesh network must use the same SSID and password. For band steering to work, the SSIDs and passwords of 2.4GHz and 5GHz must be identical. See Section 1.3.3 on page 22 and Section 1.3.4 on page 23 for more information. The controller synchronizes the SSIDs and passwords during auto-configuration.

- The Zyxel Device connects to an AP using an Ethernet cable to expand the WiFi coverage.
- The Zyxel Device connects to a WiFi extender using WiFi. You can place the WiFi extender between the Zyxel Device and the WiFi clients who require WiFi but are not in the coverage of the Zyxel Device.

The following table describes the icons used in the figure.

| LABEL | DESCRIPTION                 |
|-------|-----------------------------|
| ZD    | Router Controller           |
| AP    | Access Point                |
| WE    | WiFi Extender               |
| C1    | Client1                     |
| C2    | Client2                     |
| APC   | Access Point coverage area  |
| WEC   | WiFi Extender coverage area |

Table 2 EasyMesh Application

#### 1.3.2 Dual-Band WiFi

The Zyxel Device supports dual-band 2.4 GHz and 5 GHz WiFi. IEEE 80211a/b/g/n/ac/ax compliant clients, such as notebooks, tablets, and smartphones can wirelessly connect to the Zyxel Device to access network resources. WiFi clients can use the 2.4 GHz band for regular Internet surfing and downloading while using the 5 GHz band for time sensitive traffic like high-definition video, music, and gaming.

#### 1.3.3 AP Steering

AP steering allows WiFi clients to roam seamlessly in the EasyMesh network. AP steering helps monitor WiFi clients and drops their connections to optimize the Zyxel Device bandwidth when the clients are idle or have a low signal. When a WiFi client is dropped, it has the opportunity to reconnect to an AP or WiFi Extender with a stronger signal.

In the following example, the controller (ZD) drops the connection between the client device (C) and the WiFi Extender (WE) so that the client device (C) can connect to the Access Point (AP), which has a stronger signal.

#### 1.3.4 Band Steering

Band steering allows 2.4 GHz/5 GHz dual-band WiFi clients to move from one band to another. The controller detects if the client device are dual-band compatible. If a client device supports dual-band WiFi and the 2.4 GHZ band is congested, its 2.4 GHz connection is dropped so that it can connect to the less congested 5 GHz band.

In the following example, the Apple TV is a dual-band client device that uses the 5 GHz band.

#### 1.3.5 Daisy Chain

You can add more APs or WiFi Extenders to your EasyMesh network to form a daisy chain. Daisy chain refers to the connection from the Zyxel Device to up to three APs or WiFi Extenders to extend the WiFi connection from the router to the client.

- If the Zyxel Device has a wired downlink connection, the device connected to the Zyxel Device must be an AP.
- If the Zyxel Device has a WiFi downlink connection, the device connected to the Zyxel Device must be a WiFi Extender.

Here are some example scenarios of the Zyxel Device's daisy chain connection:

- Note: We do not recommend connecting more than three APs or WiFi Extenders in your daisy chain network.
- Note: If one of the WiFi Extenders has a WiFi uplink connection, we do not recommend linking the other WiFi Extenders in your daisy chain network with a wired connection.

Figure 13 Not Recommended Connection Example

## 1.4 MU-MIMO Technology

Multi-User, Multiple-Input, Multiple-Output (MU-MIMO) allows an AP to transmit and receive data to multiple groups of MU-MIMO enabled WiFi clients at the same time, using a technology called RF multipath. MU-MIMO divides its bandwidth evenly among all MIMO-compatible WiFi clients and keeping the WiFI signal constant for them all. Transmit Beamforming technology lets the AP focus its signals directly to WiFi clients to effectively extend the WiFi coverage and minimize dead spots. WiFi clients in the same group can also co-ordinate in order to transmit to the AP at the same time. MU-MIMO helps decrease client waiting time and increase network throughput. This will improve WiFi performance with MU-MIMO compatible WiFi clients.

#### 2X2:2 MU-MIMO

2X2:2 MU-MIMO WiFi means an AP allows two transceivers and two receivers to communicate concurrently with multiple WiFi clients, dividing up the bandwidth evenly. In **2X2:2**, the first and second number (**n** X **n**) show the number of transmit and receive antennas respectively. The third number (: **n**) means the number of data spatial streams, indicating the number of independent data signals that can be sent simultaneously from a single transmit antenna. For example, in **Figure 12**, when two WiFi devices are connected to an AP, the AP can communicate with two devices (Client **C1** and **C2**) simultaneously.

#### 4X4:4 MU-MIMO

4X4:4 MU-MIMO WiFi means an AP allows four transceivers and four receivers to communicate concurrently with multiple WiFi clients, dividing up the bandwidth evenly. For example, in **Figure 13**, when four WiFi devices are connected to an AP, the AP can communicate with four devices (Client **C1**, **C2**, **C3 and C4**) simultaneously.

#### 2.4 GHz/5 GHz MU-MIMO

The 802.11 ac standard supports only downlink traffic on the 5 GHz band while 802.11 ax supports both downlink and uplink connectivity on the 2.4 GHz and 5 GHz bands.

In a Mesh network, a downlink connection means transmitting data from an AP to a WiFi client. The AP serves as the transmitter and the WiFi client as the receiver. An uplink connection means transmitting data from a WiFi client to an AP. An Uplink connection means the AP is the receiver and the WiFi client, the transmitter.

|              | TYPE     | 802.11b/g/n | 802.11ac | 802.11ax |
|--------------|----------|-------------|----------|----------|
| 2.4 GHz WiFi | Downlink | N/A         | N/A      | YES      |
|              | Uplink   | N/A         | N/A      | YES      |
| 5 GHz WiFi   | Downlink | N/A         | YES      | YES      |
|              | Uplink   | N/A         | NO       | YES      |

#### Table 3 2.4 GHz/5 GHz MU-MIMO

## 1.5 How to Manage your Zyxel Device

You can use the following way to manage your Zyxel Device.

• Web Configurator. This is recommended for everyday management of Zyxel Device using a (supported) web browser.

• Zyxel Air. Use the Zyxel Air app (available on the App Store for Apple devices and Google Play for Android devices) for setup and management of the Zyxel Device on your smartphone. You can also use the app for finding the optimal 5G NR signal strength. To install the app, scan the QR code on the QSG.

Note: The embedded Web-based Configurator enables straightforward management and maintenance. Just insert the SIM card (with an active data plan) and make the hardware connections. See the Quick Start Guide for how to do the hardware installation, wall or pole mounting, and Internet setup.

## 1.6 Good Habits for Managing the Zyxel Device

Do the following things regularly to make the Zyxel Device more secure and to manage the Zyxel Device more effectively.

- Change the password. Use a password that is not easy to guess and that consists of different types of characters, such as numbers and letters.
- Write down the password and put it in a safe place.
- Back up the configuration (and make sure you know how to restore it). Restoring an earlier working
  configuration may be useful if the Zyxel Device becomes unstable or even crashes. If you forget your
  password to access the Web Configurator, you will have to reset the Zyxel Device to its factory
  default settings. If you backed up an earlier configuration file, you would not have to totally reconfigure the Zyxel Device. You could simply restore your last configuration. Write down any
  information your ISP provides you.

## CHAPTER 2 Hardware

## 2.1 Overview

This chapter describes the LEDs, SIM Card Slot and Ports and Buttons on the Zyxel Device and shows you how to make the hardware connections.

## 2.2 LEDs

The following figures show LEDs on the Zyxel Device. Check the LED tables below to see the WiFi or cellular connection status of the Zyxel Device.

Figure 16 NR5101 LEDs

Table 4 NR5101 LED Behavior

| LED          | COLOR | STATUS   | DESCRIPTION  |
|--------------|-------|----------|--|
| Power/USB    | Green | On       | The Zyxel Device is receiving power and ready for use.         |
|              |       | Blinking | The Zyxel Device is booting.                                   |
|              |       | Off      | The Zyxel Device is not receiving power.                       |
|              | Blue  | On       | A USB device is connected to the USB port on the Zyxel Device. |
| Internet/SMS | Green | On       | The Zyxel Device is connected to the Internet using 3G/4G.     |
|              |       | Blinking | There is a new SMS message.                                    |
|              |       | Off      | The Zyxel Device is not connected to the Internet.             |
|              | Blue  | On       | The Zyxel Device is connected to the Internet using 5G.        |

| LED             | COLOR  | STATUS             | DESCRIPTION   |
|-----------------|--------|--------------------|---|
| Cellular Signal | Green  | On                 | The signal strength is excellent.   |
| Strength        | Orange | On                 | The signal strength is fair.  |
|                 | Red    | On                 | The signal strength is poor.  |
|                 |        | Blinking           | There is no cellular signal, or signal strength is below the poor level.      |
| WiFi/WPS        | Green  | On                 | WiFi is enabled.  |
|                 |        | Blinking<br>(fast) | Data is being transmitted and received.                                       |
|                 |        | Blinking<br>(slow) | WPS is activated, and the Zyxel Device is establishing a WPS connection.      |
| Voice           | Green  | On                 | A telephone connected to the <b>PHONE</b> port has its receiver off the hook. |
|                 |        | Blinking           | The Zyxel Device is receiving an incoming call.                               |
|                 | С      | Off                | A telephone connected to the <b>PHONE</b> port has its receiver on the hook.  |

| WiFi/WPS        | Green | On       | WiFi is enabled.  |  |  |
|                 |       | Blinking | WPS is activated, and the Zyxel Device is establishing a WPS connection.                      |  |  |
|                 |       | Off      | WiFi is disabled.   |  |  |

## 2.3 SIM Card Slot

The following figures show the Micro-SIM card slot on the Zyxel Device. Insert your SIM card provided by your Internet Service Provider (ISP). Refer to the QSG for more information on hardware installations.

## 2.4 Ports and Buttons

The following figures show the ports and buttons on the Zyxel Device.

The following table describes the ports and buttons on the Zyxel Device.

| LABELS            | DESCRIPTION  |  |  |  |
|-------------------|--|--|--|--|
| ANT1-ANT2/Antenna | Install the external antennas to strengthen the cellular signal.<br>Note: To use the external antennas, you must set the <b>INT/EXT</b> switch to <b>EXT</b> . |  |  |  |
|                   |  |  |  |  |
| USB               | The USB port of the Zyxel Device is used for file sharing.   |  |  |  |
| LAN1/WAN          | LAN mode: Connect a computer to the LAN using an RJ45 cable.   |  |  |  |
|                   | WAN mode: Connect the Zyxel Device to the Internet through the WAN.  |  |  |  |
| LAN2              | Connect a computer to the LAN using an RJ45 cable.   |  |  |  |
| WiFi/WPS          | Press the WiFi/WPS button to activate WPS connection process or enable WiFi. See Table 9 on page 33 for more information.                                      |  |  |  |
| RESET             | Press the <b>RESET</b> button to reboot or reset the Zyxel Device. See Table 10 on page 35 for more information.   |  |  |  |
| ON/OFF            | Press the <b>ON/OFF</b> button after the power adapter is connected to start the Zyxel Device.   |  |  |  |
| POWER             | Connect the power adapter and press the <b>ON/OFF</b> button to start the Zyxel Device.  |  |  |  |
| Micro SIM         | Insert a Micro-SIM card into the slot with the chip facing down and the beveled corner in the top left corner.   |  |  |  |
| PHONE             | Connect a phone device for VoIP or VoLTE calls.  |  |  |  |
| INT/EXT           | Select between the internal or external cellular antennas.   |  |  |  |

Table 7 NR5101 Ports and Buttons

Figure 21 NR5103/NR5103E/FWA510 Ports and Buttons

The following table describes the ports and buttons on the Zyxel Device.

| LABELS            | DESCRIPTION  |  |  |
|-------------------|--|--|--|
| ANT1-ANT2/Antenna | Install the external antennas to strengthen the cellular signal.   |  |  |
|                   | Note: To use the external antennas, you must set the INT/EXT switch to EXT.                                      |  |  |
| USB               | The USB port of the Zyxel Device is used for file sharing.   |  |  |
| LAN2/WAN          | LAN mode: Connect a computer to the LAN using an RJ45 cable.   |  |  |
|                   | WAN mode: Connect the Zyxel Device to the Internet through the WAN.  |  |  |
| LAN1              | Connect a computer to the LAN using an RJ45 cable.   |  |  |
| WiFi/WPS          | Press the WiFi/WPS button to activate WPS connection process. See Table 9 on page 33 for more information.       |  |  |
| RESET             | Press the <b>RESET</b> button to reboot or reset the Zyxel Device. See Table 10 on page 35 for more information. |  |  |
| ON/OFF            | Press the <b>ON/OFF</b> button after the power adapter is connected to start the Zyxel Device.                   |  |  |

Table 8 NR5103/NR5103E/FWA510 Ports and Buttons

| LABELS    | DESCRIPTION  |  |  |  |
|-----------|--|--|--|--|
| POWER     | Connect the power adapter and press the ON/OFF button to start the Zyxel Device                                |  |  |  |
| Micro SIM | Insert a Micro-SIM card into the slot with the chip facing down and the beveled corner in the top left corner. |  |  |  |

## 2.5 How to Enable WiFi/WPS

The following table shows the functions of the WiFi/WPS button.

| Table 9 | How to | enable | WiFi and  | WPS          |
|---------|--------|--------|-----------|--------------|
|         | 110 10 | enable | WILL GLIG | <b>VVI J</b> |

| WIFI/WPS<br>BUTTON | FUNCTION     | NR5101                           | NR5103                           | NR5103E                          | FWA510                        |
|--------------------|--------------|----------------------------------|----------------------------------|----------------------------------|-------------------------------|
| WiFi               | Turn on WiFi | Press for 1 second               | N/A                              | N/A                              | N/A                           |
| WPS                | Activate WPS | Press for more<br>than 5 seconds | Press for more<br>than 3 seconds | Press for more<br>than 3 seconds | Press for more than 3 seconds |

#### 2.5.1 NR5101 WiFi/WPS Button

The following figure shows the WiFi/WPS button on the Zyxel Device.

#### Turning on WiFi

Press the WiFi/WPS button on the Zyxel Device and then release it.

After WiFi is turned on, the LED lights green.

#### **Activating WPS**

You can also quickly set up a secure WiFi connection between the Zyxel Device and a WPS-compatible client by adding one device at a time.

- 1 Ensure WiFi is turned on.
- 2 Press the WiFi/WPS button and release it to enable WPS.
- **3** Press the WPS button on another WPS-enabled device that is within range of the Zyxel Device within 120 seconds.

After a WiFi connection is established, the WiFi/WPS LED blinks slowly green.

#### 2.5.2 NR5103/NR5103E/FWA510 WiFi/WPS Button

The following figure shows the WiFi/WPS button on the Zyxel Device.

Figure 23 NR5103/NR5103E/FWA510 WiFi/WPS Button

#### **Activating WPS**

You can also quickly set up a secure WiFi connection between the Zyxel Device and a WPS-compatible client by adding one device at a time.

- 1 Ensure WiFi is turned on.
- 2 Press the WiFi/WPS button and release it to enable WPS.

**3** Press the WPS button on another WPS-enabled device that is within range of the Zyxel Device within 120 seconds.

After a WiFi connection is established, the WiFi/WPS LED blinks green.

## 2.6 How to Reset the Zyxel Device

Insert a thin object into the **RESET** hole of the Zyxel Device to reload the factory-default configuration file if you forget your password or IP address, or you cannot access the Web Configurator. This means that you will lose all configurations that you had previously saved. The password will be reset to the default (see the Zyxel Device label) and the IP address will be reset to **192.168.1.1**.

The following table shows the functions of the **RESET** button.

| RESET<br>BUTTON | FUNCTION                | NR5101                           | NR5103                        | NR5103E                       | FWA510                        |
|-----------------|-------------------------|----------------------------------|-------------------------------|-------------------------------|-------------------------------|
| RESET           | Reset the Zyxel Device  | Press for more<br>than 5 seconds | Press for more than 5 seconds | Press for more than 5 seconds | Press for more than 5 seconds |
| RESET           | Reboot the Zyxel Device | Press for 2-5<br>seconds         | Press for 2-5<br>seconds      | Press for 2-5<br>seconds      | Press for 2-5<br>seconds      |

Table 10 How to reset the Zyxel Device

The following figure shows the **RESET** button on the Zyxel Device.

#### Figure 24 NR5101 RESET Button

- 1 Make sure the Zyxel Device is connected to power and the POWER LED is on.
- 2 Using a thin object, press the **RESET** button.

# CHAPTER 3 Web Configurator

# 3.1 Overview

The Web Configurator is an HTML-based management interface that allows easy system setup and management through Internet browser. Use a browser that supports HTML5, such as Microsoft Edge, Mozilla Firefox, or Google Chrome. The recommended minimum screen resolution is 1024 by 768 pixels.

In order to use the Web Configurator you need to allow:

- Web browser pop-up windows from your computer.
- JavaScript (enabled by default).
- Java permissions (enabled by default).

## 3.1.1 Access the Web Configurator

- 1 Make sure your Zyxel Device hardware is properly connected (refer to the Quick Start Guide).
- 2 Make sure your computer has an IP address in the same subnet as the Zyxel Device.
- 3 Launch your web browser. If the Zyxel Device does not automatically re-direct you to the login screen, go to http://192.168.1.1.
- 4 A login screen displays. Select the language you prefer (upper right).
- 5 To access the administrative Web Configurator and manage the Zyxel Device, enter the default user name **admin** and the randomly assigned default password (see the Zyxel Device label) in the Login screen and click Login. If you have changed the password, enter your password and click Login.

#### Figure 26 Login Screen

|           | Login |   |
|-----------|-------|---|
| User Name |       |   |
| Password  |       |   |
|           |       | ٢ |
|           | Login |   |

- Note: The first time you enter the password, you will be asked to change it. Make sure the new password must contain at least one uppercase letter, one lowercase letter and one number. For some models, the password must contain at least one English character and one number. Please see the password requirement displayed on the screen.
- 6 The Connection Status screen appears. Use this screen to configure basic Internet access and WiFi settings.

# 3.2 Web Configurator Layout

As illustrated above, the main screen is divided into these parts:

- A Settings Icon (Navigation Panel and Side Bar)
- **B** Layout Icon
- **C** Main Window

## 3.2.1 Settings Icon

Click this icon (=) to see the side bar and navigation panel.

#### 3.2.1.1 Side Bar

The side bar provides some icons on the right hand side.

The icons provide the following functions.

|          | Contigurator Icons in the Title Bar   |
|----------|---|
| ICON     | DESCRIPTION   |
| Wizard   | Wizard: Click this icon to open screens where you can configure the Zyxel Device's time zone and WiFi settings. |
|          | Theme: Click this icon to select a color that you prefer and apply it to the Web Configurator.                  |
| Theme    | Theme   |
|          |   |
|          |   |
| Language | Language: Select the language you prefer.   |
| Restart  | Restart: Click this icon to reboot the Zyxel Device without turning the power off.                              |
| Logout   | Logout: Click this icon to log out of the Web Configurator.   |

Table 11 Web Configurator Icons in the Title Bar

#### 3.2.1.2 Navigation Panel

Click the menu icon (=) to display the navigation panel that contains configuration menus and icons (quick links). Click **X** to close the navigation panel.

Use the menu items on the navigation panel to open screens to configure Zyxel Device features. The following tables describe each menu item.

#### Figure 28 Navigation Panel

| Home              | ×        |
|-------------------|----------|
| Network Setting   |          |

## 3.2.2 Widget Icon

Click the Widget icon (

The following screen appears. Select a block and hold it to move around. Click the Check icon (

Figure 30 Check Icon

# CHAPTER 4 Quick Start

# 4.1 Quick Start Overview

Use the Wizard screens to configure the Zyxel Device's time zone and WiFi settings.

Note: See the technical reference chapters for background information on the features in this chapter.

# 4.2 Quick Start Setup

You can click the **Wizard** icon in the side bar to open the **Wizard** screens. After you click the **Wizard** icon, the following screen appears. Click **Let's go** to proceed with settings on time zone and WiFi networks. It will take you a few minutes to complete the settings on the **Wizard** screens. You can click **Skip** to leave the **Wizard** screens.

# 4.3 Quick Start Setup – Time Zone

Select the time zone of the Zyxel Device's location. Click Next.

Figure 32 Wizard – Time Zone

| 1<br>Time zone      | > 2<br>WiFi |    |
|---------------------|-------------|----|
| Time Zone           |             |    |
| (GMT-05:00) Eastern | Time •      | X. |
| Back                | Next        |    |

# 4.4 Quick Start Setup – WiFi

Turn WiFi on or off. If you keep it on, record the **WiFi Name** and **Password** in this screen so you can configure your WiFi clients to connect to the Zyxel Device. If you want to show or hide your WiFi password, click the Eye icon (*(*)).

| Figure 33 | Wizard – Wireless |
|-----------|-------------------|

| WiFi Name     |           | WiFi Name      |
| Zyxel_4BAA    |           | Zyxel_4BAA_5G  |
| WiFi Password |           | WIFI Password  |
| *****         | 0         | **********     |
| Strength      | strong    | Strength stron |
|               | De        | one            |

Note: You can also enable the wireless service using any of the following methods: Click **Network Setting** > **Wireless** to open the **General** screen. Then select **Enable** in the **WiFi** field. Or, press the **WiFi** button for one second.

# 4.5 Quick Start Setup – Finish

Your Zyxel Device saves your settings and attempts to connect to the Internet.

# CHAPTER 5 Web Interface Tutorials

# 5.1 Web Interface Overview

This chapter shows you how to use the Zyxel Device's various features.

- Wired Network Setup
- WiFi Network Setup
- Cellular Network Setup
- USB Applications
- Network Security
- Internet Calls
- Device Maintenance

# 5.2 Wired Network Setup

This section shows you how to set up a wired connection.

Set the Zyxel Device to Routing mode or Bridge mode on this connection as follows:

- Use **Routing** mode if you want the Zyxel Device to use routing mode functions such as **NAT**, **Firewall**, or **DHCP Server**. You will need to reconfigure your network if you have an existing router.
- Use **Bridge** mode to pass the ISP-assigned IP address(es) to your devices connected to the LAN port. All traffic from the Internet passes through the Zyxel Device directly to devices connected to the LAN port. Use this mode if you already have a router with complete routing functions in your network.

## 5.2.1 Setting Up an Ethernet Connection

If you connect to the Internet through an Ethernet connection, you need to connect a broadband modem or router with Internet access to the WAN Ethernet port on the Zyxel Device. You need to configure the Internet settings from the broadband modem or router on the Zyxel Device. First, make sure you have Internet access through the broadband modem or router by connecting directly to it.

This example shows you how to configure an Ethernet WAN connection.

- 1 Make sure you have the Ethernet WAN port connect to a modem or router.
- 2 Go to Network Setting > Broadband and then the following screen appears. Click Add New WAN Interface to add a WAN connection.

|     |            |           |             |                     | Br        | oadb        | and           |           |                    |      |                 |               |

3 To set the Zyxel Device to Routing mode, see Section 1 on page 48.

To set the Zyxel Device to Bridge mode, see Section 1 on page 49.

#### **Routing Mode**

1 In this routing mode example, configure the following information for the Ethernet WAN connection.

| General                          |                   |
|----------------------------------|-------------------|
| Name                             | My ETH Connection |
| Туре                             | Ethernet          |
| Connection Mode                  | Routing           |
| Encapsulation (Internet<br>Type) | IPOE              |
| IPv6/IPv4 Mode                   | IPv4 Only         |

- 2 Enter the General settings provided by your Internet service provider.
  - Enter a Name to identify your WAN connection.
  - Set the Type to Ethernet.
  - Set your Ethernet connection Mode to Routing.
  - Choose the **Encapsulation** specified by your Internet service provider. For this example, select **IPoE** as the WAN encapsulation type.
  - Set the IPv4/IPv6 Mode to IPv4 Only.
- 3 Under Routing Feature, enable NAT and Apply as Default Gateway.
- 4 For the rest of the fields, use the default settings.
- 5 Click **Apply** to save your settings.

#### Bridge Mode

1 In this bridge mode example, configure the following information for the Ethernet WAN connection.

| General         |                   |
|-----------------|-------------------|
| Name            | My ETH Connection |
| Туре            | Ethernet          |
| Connection Mode | Bridge            |

- 2 Enter the General settings provided by your Internet service provider.
  - Enter a Name to identify your WAN connection.
  - Set the Type to Ethernet.
  - Set your Ethernet connection Mode to Bridge.

- **3** For the rest of the fields, use the default settings.
- 4 Click **Apply** to save your settings.

| <    |                   | Edit WAN Interfo | ICe  |          |

## 5.3 WiFi Network Setup

In this example, you want to set up a WiFi network so that you can use your notebook to access the Internet. In this WiFi network, the Zyxel Device is an access point (AP), and the notebook is a WiFi client. The WiFi client can access the Internet through the AP.

Figure 34 WiFi Network Setup

See the label on the Zyxel Device for the WiFi network settings and then connect manually to the Zyxel Device. Alternatively, you can connect to the Zyxel Device WiFi network using WPS. See Section 5.3.2 on page 52.

## 5.3.1 Changing Security on a WiFi Network

This example changes the default security settings of a WiFi network to the following:

| SSID           | Example                     |
|----------------|-----------------------------|
| Security Mode  | WPA3-SAE/WPA2-PSK           |
| Pre-Shared Key | DoNotStealMyWirelessNetwork |
| 802.11 Mode    | 802.11b/g/n Mixed           |

NR/FWA Indoor Series User's Guide

1 Go to the Network Setting > Wireless > General screen. Select More Secure as the security level and WPA3-SAE/WPA2-PSK as the security mode. Configure the screen using the provided parameters. Click Apply.

You can now use the WPS feature to establish a WiFi connection between your notebook and the Zyxel Device (see Section 5.3.2 on page 52). Now use the new security settings to connect to the Internet through the Zyxel Device using WiFi.

## 5.3.2 Connecting to the Zyxel Device's WiFi Network Using WPS

This section shows you how to connect a WiFi device to the Zyxel Device's WiFi network using WPS. WPS (Wi-Fi Protected Setup) is a security standard that allows devices to connect to a router securely without you having to enter a password. There are two methods:

- Push Button Configuration (PBC) Connect to the WiFi network by pressing a button. This is the simplest method.
- PIN Configuration Connect to the WiFi network by entering a PIN (Personal Identification Number) from a WiFi-enabled device in the Zyxel Device's Web Configurator. This is the more secure method, because one device can authenticate the other.

#### 5.3.2.1 WPS Push Button Configuration (PBC)

This example shows how to connect to the Zyxel Device's WiFi network from a notebook computer running Windows 10.

- 1 Make sure that your Zyxel Device is turned on, and your notebook is within range of the Zyxel Device's WiFi signal.
- 2 Push and hold the WPS button located on the Zyxel Device until the WiFi or WPS LED starts blinking slowly. Alternatively, log into the Zyxel Device's Web Configurator, and then go to the Network Setting > Wireless > WPS screen. Enable WPS and Method 1 PBC, click Apply, and then click the WPS button.

|  | Wireless   |   |
|--|--|---|

| Add a new device with WPS Method   |  |   |
| Method 1 PBC   | Cen Method 2 PIN   | ြ <sub>ကြွ</sub> Method 3   |
| Step1.Click WPS button   | 3step1.Enter the PIN of your new wireless<br>client device and then click Register                             | Enter AP's PIN Number in wireless Client<br>Current state Configured                                |
| Step2.Press the WPS button on your new wireless client device within 120   | Register   | <ol> <li>Please release configuration if you want<br/>to configure the wireless settings</li> </ol> |
| seconds  | Step2.Press the WPS button on your new<br>wireless client device within 120                                    | Release Configuration   |
|  | seconds  | 2. Enter current PIN number on your wireless<br>client  |
|  |  | Generate New PIN  |
| Note   |  |   |
| (1) If WPS is Enabled, UPnP will automatically be tu   | med on.  |   |
| <ul><li>(2) The Zyxel Device applies the security settings of</li><li>(3) The WPS switch is grayed out when wireless LAN</li></ul> |  |   |
|  | Cancel Apply 2   |   |

3 In Windows 10, click on the Network icon in the system tray to open the list of available WiFi networks.

**4** Locate the WiFi network of the Zyxel Device. The default WiFi network name is "Zyxel\_XXXX" (2.4G) or "Zyxel\_XXXX\_5G" (5G). Then click **Connect**.

The Zyxel Device sends the WiFi network settings to Windows using WPS. Windows displays "Getting settings from the router".

The WiFi device is then able to connect to the WiFi network securely.

#### 5.3.2.2 WPS PIN Configuration

The WPS PIN (Personal Identification Number) method is a more secure version of WPS, used by WiFienabled devices such as printers. To use this connection method, you need to log into the Zyxel Device's Web Configurator.

- 1 Enable WiFi on the device you want to connect to the WiFi network. Then, note down the WPS PIN in the device's WiFi settings.
- 2 Log into Zyxel Device's Web Configurator, and then go to the Network Setting > Wireless > WPS screen. Enable WPS, and then click Apply.
- 3 Enable Method 2 PIN, and then click Apply. Enter the PIN of the WiFi device, and then click Register.

4 Within 2 minutes, enable WPS on the WiFi device.

## 5.3.3 Setting Up a Guest Network

The Zyxel Device authenticates the WiFi device using the PIN, and then sends the WiFi network settings to the device using WPS. This process may take up to 2 minutes. The WiFi device is then able to connect to the WiFi network securely. A company wants to create two WiFi networks for different groups of users as shown in the following figure. Each WiFi network has its own SSID and security mode. Both networks are accessible on both 2.4G and 5G WiFi bands.

- Employees using the **General** WiFi network group will have access to the local network and the Internet.
- Visitors using the **Guest** WiFi network group with a different SSID and password will have access to the Internet only.

Use the following parameters to set up the WiFi network groups.

|                | GENERAL        | GUEST       |
|----------------|----------------|-------------|
| 2.4/5G SSID    | Employee       | Guest       |
| Security Level | More Secure    | More Secure |
| Security Mode  | WPA2-PSK       | WPA2-PSK    |
| Pre-Shared Key | ForCompanyOnly | guest123    |

Go to the **Network Setting** > **Wireless** > **General** screen. Use this screen to set up the company's general WiFi network group. Configure the screen using the provided parameters and click **Apply**. Note that if you have employees using 2.4G and 5G devices, enable **Keep the same settings for 2.4G and 5G wireless networks** to use the same SSID and password. Clear it if you want to configure different SSIDs and passwords for 2.4G and 5G bands.

|   |   |  | Wireless   |   |                                     |

7 Check the status of Guest in the Guest/More AP screen. A yellow bulb under Status means the SSID is active and ready for WiFi access.

## 5.3.4 Setting Up Two Guest WiFi Networks on Different WiFi Bands

In this example, a company wants to create two Guest WiFi networks: one for the **Guest** group and the other for the **VIP** group as shown in the following figure. Each network will have its SSID and security mode to access the internet.

• The **VIP** group will use the 5G band.

The Company will use the following parameters to set up the WiFi network groups.

| BAND           | 2.4G              | 5G                |
|----------------|-------------------|-------------------|
| SSID           | Guest             | VIP               |
| Security Mode  | WPA3-SAE/WPA2-PSK | WPA3-SAE/WPA2-PSK |
| Pre-Shared Key | guest123          | 123456789         |

Table 13 WiFi Settings Parameters Example

1 Go to the Wireless > General screen and set Band to 2.4GHz to configure 2.4G Guest WiFi settings for Guest. Click Apply.

Note: You will not be able to configure the 2.4G and 5G Guest WiFi settings separately if **Keep** the same settings for 2.4G and 5G wireless network is enabled.

|  | Wireless  |                             |

# 5.4 Cellular Network Setup

This section shows you how to set up a cellular network.

## 5.4.1 Setting up a Cellular Network Connection

This section gives you an example on how to connect to the Internet using over a cellular connection.

- 1 Insert a SIM Card into your Zyxel Device SIM slot. Make sure this SIM card has an active data plan with your Internet Service Provider (ISP).
- 2 Connect your Zyxel Device to your computer, and log into the Web Configurator.
- 3 If your SIM has a PIN Code, enter this code in the Network Setting > Broadband > Cellular SIM screen.

Use the Home screen to check the Internet Status (IPv4) or Internet Status (IPv6). If it shows Connected this means your Internet connection is up.

# 5.5 USB Applications

This section shows you how to set up a cellular backup network, access shared folders and play files through Window Media using a USB device.

See Table 1 on page 17 for more information.

## 5.5.1 File Sharing

This section shows you how to create a shared folder on your Zyxel Device through a USB device and allow others to access the shared folder with File Sharing services.

### 5.5.1.1 Setting up File Sharing on Your Zyxel Device

- 1 Before enabling file sharing in the Zyxel Device, please set up your shared folders beforehand in your USB device.
- 2 Connect your USB device to the USB port of the Zyxel Device.
- 3 Go to the Network Setting > USB Service > File Sharing screen. Enable File Sharing Services and click Apply to activate the file sharing function. The Zyxel Device automatically adds your USB device to the Information table.

|   |  | USB Service |                                      |                     |

- 5 The Add New Share screen appears.
  - Select your USB device from the Volume drop-down list box.
  - Enter a **Description** name for the added share to identify the device.
  - Click Browse and the Browse Directory screen appears.

|              | Add New Share   | > |
|--------------|-----------------|---|
|              |                 |   |
| Volume       | usb1_sda1       |   |
| Share Path   | BobShare Browse |   |
| Description  | Вор             |   |
| Access Level | Public •        |   |
|              |                 |   |
|              | Cancel OK       |   |

• On the **Browse Directory** screen, select the folder that you want to add as a share. In this example, select **BobShare** and then click **OK**.

| Browse Directory |      |           |  |  |  |
|------------------|------|-----------|--|--|--|
| Select           | Туре | Name      |  |  |  |
| 0                | Ð    | BobShare  |  |  |  |
| 0                | þ    | JoshShare |  |  |  |
|                  |      |           |  |  |  |
|                  | Co   | ancel OK  |  |  |  |

• In Access Level, select Public to let the share to be accessed by all users connected to the Zyxel Device. Otherwise, select Security to let the share to be accessed by specific users to access only. Click OK to save the settings.

|              | Add New Share |    |           |       |  |  |
|--------------|---------------|----|-----------|-------|--|--|
| Volume       | usb1_sda1     |    |           |       |  |  |
| Share Path   |               |    | В         | rowse |  |  |
| Description  |               |    |           |       |  |  |
| Access Level | Security      |    |           |       |  |  |
|              | Allowed       |    | User Name |       |  |  |
|              |               |    | admin     |       |  |  |
|              |               |    |           |       |  |  |
|              | Cancel        | OK |           |       |  |  |

6 To set Access level to Security, you need to create one or more users accounts. Under Account Management, click Add New User to open the User Account screen.

| Account Management | + Add New User |
|--------------------|----------------|
| Status             | User Name      |
| 2                  | admin          |
|                    |                |
|                    | Cancel Apply   |

7 After you create a new user account, the screen looks like the following.

| Account Managem | ient   |        |           | 🛨 Add New User |
|-----------------|--------|--------|-----------|----------------|
|                 | Status |        | User Name |                |
|                 | 8      |        | admin     |                |
|                 | 2      |        | Zyxel     |                |
|                 |        |        |           |                |
|                 |        | Cancel | Apply     |                |

8 File sharing is now configured. You can see the USB storage device listed in the table below.

| Share Direc | ctory List |            |                          | +                 | Add New Share |
|-------------|------------|------------|--------------------------|-------------------|---------------|
| Active      | Status     | Share Name | Share Path               | Share Description | Modify        |
|             | ę          | BobShare   | /mnt/usb1_sda1/BobShare  | Bob               | 6             |
| <b>~</b>    | <b>9</b>   | JoshShare  | /mnt/usb1_sda1/JoshShare | Josh              | 6 1           |

#### 5.5.1.2 Accessing Your Shared Files From a Computer

You can use Windows Explorer to access the USB storage devices connected to the Zyxel Device.

- Note: This example shows you how to use Microsoft Windows 10 to browse shared files in a share called (usb1\_sda)Zoeys file. Refer to your operating system's documentation for how to browse your file structure.
- **1** Open Windows Explorer.
- 2 In the Windows Explorer's address bar, enter a double backslash "\\" followed by the IP address of the Zyxel Device (the default IP address of the Zyxel Device is 192.168.1.1

- 3 Double-click on (usb1\_sda)Zoeys file, and then enter the share's username and password if prompted.
- 4 After you access (usb1\_sda)Zoeys file through your Zyxel Device, you do not have to log in again unless you restart your computer.

# 5.6 Network Security

This section shows you how to configure a Firewall rule, Parental Control rule, and MAC Filter rule.

## 5.6.1 Configuring a Firewall Rule

You can enable the firewall to protect your LAN computers from malicious attacks from the Internet.

- 1 Go to the Security > Firewall > General screen.
- 2 Select IPv4 Firewall/IPv6 Firewall to enable the firewall, and then click Apply.

| that a higher firewall | level means more restrictio                                | ons to the I | nternet activities you  | want to perfo | rm. |  |
|------------------------|--|--------------|-------------------------|---------------|-----|--|
| IPv6 Firewall          |  |              |                         |               |     |  |
|                        | -  | Low          | Medium<br>(Recommended) | High          |     |  |
|                        | LAN to WAN   |              | •<br>Ø                  |               |     |  |
|                        | WAN to LAN   |              | 8                       |               |     |  |
| lote                   |  |              |                         |               |     |  |
| 1                      | iccess to all internet service                             |              |                         |               |     |  |
| 1                      | iccess from other compute                                  |              |                         |               |     |  |
|                        | vel is set to "High", access to<br>,DNS,IMAP,POP3,SMTP and |              | wing services is allow  | ea:           |     |  |

3 Open the Access Control screen, click Add New ACL Rule to create a rule.

| Firewall   |  |   |  |                   |                     |                  |  |

| schedulerkules            |                 | Add New F    | lule    |   |                  |

- Filter Name: Enter a name to identify the firewall rule.
- Source IP Address: Enter the IP address of the computer that initializes traffic for the application or service.
- Destination IP Address: Enter the IP address of the computer to which traffic for the application or service is entering.
- Protocol: Select the protocol (ALL, TCP/UDP, TCP, UDP, ICMP or ICMPv6) used to transport the packets.

- Policy: Select whether to (ACCEPT, DROP, or REJECT) the packets.
- Direction: Select the direction (WAN to LAN, LAN to WAN, WAN to ROUTER, or LAN to ROUTER) of the traffic to which this rule applies.
- 5 Select Enable Rate Limit to activate the rules you created. Click OK.

## 5.6.2 Parental Control

This section shows you how to configure rules for accessing the Internet using parental control.

Note: The style and features of your parental control vary depending on the Zyxel Device you are using.

### 5.6.2.1 Configuring Parental Control Schedule and Filter

Parental Control Profile (PCP) allows you to set up a rule for:

- Internet usage scheduling.
- Websites and URL keyword blocking.

Use this feature to:

- Limit the days and times a user can access the Internet.
- Limit the websites a user can access on the Internet.

This example shows you how to block a user from accessing the Internet during time for studying. It also shows you how to stop a user from accessing specific websites.

Use the parameters below to configure a schedule rule and a URL keyword blocking rule.

| PROFILE NAME | INTERNET ACCESS<br>SCHEDULE | NETWORK SERVICE          | SITE/URL KEYWORD             |
|--------------|-----------------------------|--------------------------|------------------------------|
| Study        | Day:                        | Network Service Setting: | Block or Allow the Web Site: |
|              | Monday to Friday            | Block                    | Block the web URLs           |
|              | Time:                       | Service Name:            | Website:                     |
|              | 8:00 to 11:00               | HTTP                     | gambling                     |
|              | 13:00 to 17:00              | Protocol:                |                              |
|              |                             | TCP                      |                              |
|              |                             | Port:                    |                              |
|              |                             | 80                       |                              |

#### Parental Control Screen

Open the **Parental Control** screen. Select **Enable** under **General** to enable parental control. Then click **Add New PCP** to add a rule.

|                        |              | Par   | ental Control               |                      |                    |            |
|------------------------|--------------|---|-----------------------------|----------------------|--------------------|------------|
|                        |              | you to limit the time a user co<br>g in specified online activities                               |                             | d prevent users fron | n viewing inappro  | opriate    |

| # Status               | PCP<br>Name  | Home Network User<br>MAC  | Internet Access<br>Schedule | Network<br>Service   | Website<br>Blocked | Modify     |
|                        |              | Cance   |                             |                      |                    |            |

#### Add New PCP Screen

- 1 Go to Parental Control > Add New PCP. Under General:
  - Select Enable to enable the rule you are configuring.
  - Enter the Parental Control Profile Name given in the above parameter.
  - Select an user this rule applies to in **Home Network User**, then click **Add**. You will see the MAC address of the user you just select in **Rule List**.

| General                       |  |
|-------------------------------|--|
| Active                        | Enable O bisable (Settings are invalid when disable) |
| Parental Control Profile Name | Study  |
| Home Network User             | TWPCNT03116-01 (dc-4a-3e-40-ec-67)                   |
| Rule List                     |  |
| User /                        | MAC Address Delete                                   |
| DC-4/                         | A-3E-40-EC-67  |
|                               |  |

#### 2 Under Internet Access Schedule:

- Click Add New Time to add a second schedule.
- Use the parameter given above to configure the time settings of your schedule.

| Internet Access Sch | nedule                      |   |
|---------------------|-----------------------------|---|
| Day                 | Mon Tue Wed Thu Fri Sat Sun |   |
| Time (Oberld Timel) | + Add New Time              |   |
| Time (Start-End)    | 13:00 17:00                 | Û |

- 3 Under Network Service:
  - In Network Service Setting, select Block.
  - Click Add New Service, then use the parameter given above to configure settings for the Internet service you are blocking.

| Network Serv  | vice         |       |          |                     |
|---------------|--------------|-------|----------|---------------------|
| Network Servi | ce Setting   | Block | •        | Selected Service(s) |
|               |              |       |          | + Add New Service   |
| #             | Service Name | Proto | col:Port | Modify              |
| 1             | http         | TC    | P:80     | ØÔ                  |
|               |              |       |          |                     |

- 4 Under Site / URL Keyword:
  - Select Block the web URLs in Block or Allow the Web Site.
  - Click Add, then use the parameter given above to configure settings for the URL keyword you are blocking.
  - Select Redirect blocked site to Zyxel Family Safety page to redirect the web browser to the Zyxel Family Safety page if he or she tries to access a website with the blocked URL keyword.

| lite/URL Keyword              | Block the web URLs                  | •  | + Add   |
|-------------------------------|-------------------------------------|--|---------|
| #                             | Website                             | Modify                                       |         |
| 1                             | gambling                            | 2 6  |         |
| Redirect blocked site to Zyxe | el Family Safety page 📋 Zyxel Famil | y Safety page will replace any sites from th | e above |

5 Click OK to save your settings.

## 5.6.3 Configuring a MAC Address Filter for Wired LAN Connections

You can use a MAC address filter to exclusively allow or permanently block someone from the wired LAN network.

This example shows that computer B is not allowed access to the wired LAN network.

Figure 35 Configure a MAC Address Filter Example

1 Go to the Security > MAC Filter > MAC Filter screen. Under MAC Address Filter, select Enable.

|                                 |   | MAC                                 | Filter   |                         |

## 5.7 Internet Calls

This section shows you how to make Internet calls.

## 5.7.1 Configuring VoIP

To make voice calls over the Internet, you must set up a Session Initiation Protocol (SIP) provider and SIP account on the Zyxel Device. You should have an account with a SIP service provider already set up.

## 5.7.2 Adding a SIP Service Provider

Follow the steps below to add a SIP service provider.

- 1 Make sure your Zyxel Device is connected to the Internet.
- 2 Open the Web Configurator.
- 3 Go to the Voice > SIP > SIP Service Provider screen. Click the Add New Provider button to add the SIP Service Provider.

| SIP / | Account    <b>SIP Service Provide</b>                             | er _                                  |                         |                    |            |

## 5.7.3 Adding a SIP Account

The SIP account must be associated with the SIP service provider configured above. You may configure several SIP accounts for the same service provider. Follow the steps below to set up your SIP account:

- 1 Make sure your Zyxel Device is connected to the Internet.
- 2 Open the Web Configurator.
- **3** Go to the Voice > SIP > SIP Account screen.
- 4 Click the Add New Account button on the SIP Account screen to add a SIP account and map it to a phone port.

|             | can make calls o<br>ervice provider. | ver the Internet using V                           | olP technology. For this, you                                | first need to set up a SIP acc  | ount with a           |

## 5.7.4 Configuring a Phone

You must now configure the phone port to use the SIP account you just configured.

1 Go to the Voice > Phone > Phone Device screen.

2 Click the **Modify** icon of **PHONE1** to configure PHONE1 on your Zyxel Device. The following screen appears.

| will<br>is n |                    | cific SIP address receives o | n phones used for Internet phone<br>an incoming call, and which SIP c |                                 |        |
|--------------|--------------------|------------------------------|---|---------------------------------|--------|
|              |                    |                              |   |                                 |        |
| #            | Phone ID           | Internal Number              | Incoming SIP Number   | Outgoing SIP Number             | Modify |
| #            | Phone ID<br>PHONE1 | Internal Number              | Incoming SIP Number<br>Account1                                       | Outgoing SIP Number<br>Account1 | Modify |

- **3** Under SIP1 SIP Account to Make Outgoing Call, select SIP1 to have the phone connected to the first phone port use the registered SIP1 account to make outgoing calls.
- 4 Under SIP Account(s) to Receive Incoming Call, select SIP1 to have the phone connected to the first phone port receive phone calls for the SIP1 account. Click OK to save your changes.

## 5.7.5 Making a VoIP Call

Follow these steps to make a phone call using Voice over IP (VoIP).

- 1 Make sure you connect a telephone to phone port 1 on the Zyxel Device.
- 2 Make sure the Zyxel Device is turned on and connected to the Internet.

- **3** Pick up the phone receiver.
- 4 Dial the VoIP phone number you want to call.

## 5.7.6 Making a VoLTE Phone Call

Follow these steps to make a phone calling using Voice over LTE (VoLTE).

- 1 Make sure that your SIM card supports VoLTE or Vo3G.
- 2 Log into the Web Configurator.
- **3** Go to the **Configuration** > **Voice** > **Voice** Mode screen.
- 4 On the Voice Mode screen, select VoLTE service, and then click Apply. The Zyxel Device restarts.

| Please select a voice serv   | ice on the Zyxel Device.     |       |  |
|------------------------------|------------------------------|-------|--|
| Voice Service                | VolP service O VoLTE service | vice  |  |
| Note                         |                              |       |  |
| If Voice Service is changed, | system will reboot.          |       |  |
|                              | Cancel                       | Apply |  |

- 5 Connect an analog telephone to a **PHONE** port on the Zyxel Device.
- 6 Pick up the phone receiver.
- 7 Dial the phone number you want to call.

## 5.8 Device Maintenance

This section shows you how to upgrade the Zyxel Device firmware, back up the configuration and restore the Zyxel Device to its previous or default settings.

## 5.8.1 Upgrading the Firmware

Upload the router firmware to the Zyxel Device for feature enhancements.

- 1 Download the correct firmware file from the download library at the Zyxel website. The model code for the Zyxel Device in this example is v5.13(ABLZ.1) Note the model code for your Zyxel Device. Unzip the file.
- 2 Go to the Maintenance > Firmware Upgrade screen.
- 3 Click Browse/Choose File and select the file with a ".bin" extension to upload. Click Upload.

| Firmware Upgrade is where you can update the de<br>download the latest firmware file from the manufac | and the second | upgrading the latest firmware. You can |
|---|--|--|
| Upgrade Firmware  |  |  |
| Restore Default Settings After Firmware Upgrade   |  |  |
| Current Firmware Version: V5.13(ABLZ.1)b4   |  | $\frown$                               |
| File Path   | Choose File No file chosen   |  |
| Upgrade WWAN Package  |  |  |
| Current WWAN Package Version: 1.16  |  |  |
| File Path   | Choose File No file chosen   | Upload                                 |

4 This process may take up to 2 minutes to finish. After 2 minutes, log in again and check your new firmware version in the **Connection Status** screen.

## 5.8.2 Backing up the Device Configuration

Back up a configuration file allows you to return to your previous settings.

- 1 Go to the Maintenance > Backup/Restore screen.
- 2 Under Backup Configuration, click Backup. A configuration file is saved to your computer. In this case, the Backup/Restore file is saved.

| Backup/Restore  |              |          |
|---|--------------|----------|
| Information related to factory default settings and backup configuration are shown in this screen. Yo to restore previous device configurations.  | ou can also  | use this |

## 5.8.3 Restoring the Device Configuration

This section shows you how to restore a previously-saved configuration file from your computer to your Zyxel Device.

- 1 Go to the Maintenance > Backup/Restore screen.
- 2 Under Restore Configuration, click Browse/Choose File, and then select the configuration file that you want to upload. Click Upload.

| Backup/Restore   |
|--|
| Information related to factory default settings and backup configuration are shown in this screen. You can also use this to restore previous device configurations.  |
| Backup Configuration allows you to back up (save) the Zyxel Device's current configuration to a file on your computer. Once your Zyxel Device is configured and functioning properly, it is highly recommended that you back up your configuration file before making configuration changes. |
| Restore Configuration allows you to upload a new or previously saved configuration file from your computer to your Zyxel Device.   |
| Backup Configuration<br>Click Backup to save the current configuration of your system to your computer.  |
| Restore Configuration  |
| To restore a previously saved configuration file to your system, browse to the location of the configuration file and click Upload.  |
| File Path C:\Users\NT03139\Do Browse Upload  |
| Back to Factory Default Settings   |
| Click Reset to clear all user-entered configuration information and return to factory default settings. After resetting, the   |
| - Password is printed on a label on the bottom of the device, written after the text "Password".   |
| - LAN IP address will be 192.168.1.1   |
| - DHCP will be reset to default setting  |
| Reset  |

3 The Zyxel Device automatically restarts after the configuration file is successfully uploaded. Wait for one minute before logging into the Zyxel Device again. Go to the **Connection Status** page to check the firmware version after the reboot.

# PART II Technical Reference

## CHAPTER 6 Connection Status

## 6.1 Connection Status Overview

After you log into the Web Configurator, the **Connection Status** screen appears. You can configure basic Internet access and WiFi settings in this screen. It also shows the network status of the Zyxel Device and computers or devices connected to it.

## 6.1.1 Connectivity

Use this screen to view the network connection status of the Zyxel Device and its clients.

Click the Arrow icon (>) to view IP addresses and MAC addresses of the wireless and wired devices connected to the Zyxel Device.

Figure 37 Connectivity: Connected Devices

You can change the icon and name of a connected device. Place your mouse within the device block, and an Edit icon (2) will appear. Click the Edit icon, and you'll see there are several icon choices for you to select. Enter a name in the **Device Name** field for a connected device. Click to enable (**C**) **Internet Blocking** for a connected WiFi client.

## 6.1.2 Icon and Device Name

Select an icon and/or enter a name in the **Device Name** field for a connected device. Click to enable (
) Internet Blocking (or Active) for a connected WiFi client. Click Save to save your changes.

## 6.1.3 System Info

Use this screen to view the basic system information of the Zyxel Device.

Each field is described in the following table.

| LABEL            | DESCRIPTION  |  |
|------------------|--|--|
| Host Name        | This field displays the Zyxel Device system name. It is used for identification.   |  |
| Model Name       | This shows the model number of your Zyxel Device.  |  |
| Serial Number    | nis field displays the serial number of the Zyxel Device.  |  |
| Firmware Version | This is the current version of the firmware inside the Zyxel Device.   |  |
| System Uptime    | This field displays how long the Zyxel Device has been running since it last started up. The Zyxel Device starts up when you plug it in, when you restart it (Maintenance > Reboot), or when you reset it. |  |
| APN              | This field displays the Access Point Name (APN).   |  |
| Mode             | This field displays the current mode of your Zyxel Device.   |  |

#### Table 14 System Info: Detailed Information

| LABEL                      | DESCRIPTION  |  |  |  |
|----------------------------|--|--|--|--|
| Primary DNS<br>server      | This field displays the first DNS server address assigned by the ISP.  |  |  |  |
| Secondary DNS<br>server    | This field displays the second DNS server address assigned by the ISP.   |  |  |  |
| Primary DNSv6<br>server    | This field displays the first DNS server IPv6 address assigned by the ISP.   |  |  |  |
| Secondary<br>DNSv6 server  | his field displays the second DNS server IPv6 address assigned by the ISP.   |  |  |  |
| LAN Information            | •  |  |  |  |
| IP Address                 | This is the current IP address of the Zyxel Device in the LAN.   |  |  |  |
| Subnet Mask                | This is the current subnet mask in the LAN.  |  |  |  |
| IPv6 Address               | This is the current IPv6 address of the Zyxel Device in the LAN.   |  |  |  |
| IPv6 Link Local<br>Address | This field displays the current link-local address of the Zyxel Device for the LAN interface.  |  |  |  |
| Address                    | A link-local address is a special type of the IP address that is only valid for communication within the local network segment or broadcast domain of the device. Typically, link-local addresses are used for automatic address configuration and neighbor discovery protocols. |  |  |  |
| DHCP                       | This field displays what DHCP services the Zyxel Device is providing to the LAN. The possible values are:  |  |  |  |
|                            | Server – The Zyxel Device is a DHCP server in the LAN. It assigns IP addresses to other computers in the LAN.  |  |  |  |
|                            | <b>Relay</b> – The Zyxel Device acts as a surrogate DHCP server and relays DHCP requests and responses between the remote server and the clients.  |  |  |  |
|                            | Disable – The Zyxel Device is not providing any DHCP services to the LAN.  |  |  |  |
| Security                   | •  |  |  |  |
| Firewall                   | This displays the firewall's current security level (High, Medium, Low, or Disabled).  |  |  |  |
| WLAN Information           | •  |  |  |  |
| MAC Address                | This shows the WiFi adapter MAC (Media Access Control) Address of the WiFi interface.  |  |  |  |
| Status                     | This displays whether the WLAN is activated.   |  |  |  |
| SSID                       | This is the descriptive name used to identify the Zyxel Device in a WLAN.  |  |  |  |
| Channel                    | This is the channel number currently used by the WiFi interface.   |  |  |  |
| Security                   | This displays the type of security mode the WiFi interface is using in the WLAN.   |  |  |  |
| 802.11 Mode                | This displays the type of 802.11 mode the WiFi interface is using in the WLAN.   |  |  |  |
| WPS                        | This displays whether WPS is activated on the WiFi interface.  |  |  |  |

 Table 14
 System Info: Detailed Information (continued)

## 6.1.4 Cellular Info

Use this screen to view cellular connection information, details on signal strength that you can use as a reference for positioning the Zyxel Device. SIM card and module information is also shown in the screen.

The following table describes the labels in this screen.

Table 15 Cellular Info: Detailed Information

| LABEL                | DESCRIPTION   |  |  |
|----------------------|---|--|--|
| Module Informe       | ation   |  |  |
| IMEI                 | This shows the International Mobile Equipment Identity of the Zyxel Device. |  |  |
| Module SW<br>Version | This shows the software version of the cellular network module.             |  |  |
| SIM Status           |   |  |  |

| Table 15 | Cellular Info: Detailed Information | (continued) |
|----------|-------------------------------------|-------------|
|          | Cellular Info: Detailed Information | (conninueu) |

| LABEL                     | DESCRIPTION  |
|---------------------------|--|
| SIM Card Status           | This displays the SIM card status:   |
|                           | None – the Zyxel Device does not detect that there is a SIM card inserted.   |
|                           | Available – the SIM card could either have or does not have PIN code security.   |
|                           | Locked – the SIM card has PIN code security, but you did not enter the PIN code yet.   |
|                           | <b>Blocked</b> – you entered an incorrect PIN code too many times, so the SIM card has been locked; call the ISP for a PUK (Pin Unlock Key) to unlock the SIM card.  |
|                           | Error – the Zyxel Device detected that the SIM card has errors.  |
| IMSI                      | This displays the International Mobile Subscriber Identity (IMSI) of the installed SIM card. An IMSI is a unique ID used to identify a mobile subscriber in a mobile network.  |
| ICCID                     | Integrated Circuit Card Identifier (ICCID). This is the serial number of the SIM card.   |
| PIN Protection            | A PIN (Personal Identification Number) code is a key to a SIM card. Without the PIN code, you cannot use the SIM card.   |
|                           | Shows <b>Enable</b> if the service provider requires you to enter a PIN to use the SIM card.   |
|                           | Shows <b>Disable</b> if the service provider lets you use the SIM without inputting a PIN.   |
| PIN Remaining<br>Attempts | This is how many more times you can try to enter the PIN code before the ISP blocks your SIM card.   |
| IP Passthrough St         | atus   |
| IP Passthrough            | This displays if IP Passthrough is enabled on the Zyxel Device.  |
| Enable                    | IP Passthrough allows a LAN computer on the local network of the Zyxel Device to have access to web services using the public IP address. When IP Passthrough is configured, all traffic is forwarded to the LAN computer and will not go through NAT.   |
| IP Passthrough<br>Mode    | This displays the IP Passthrough mode.   |
|                           | This displays <b>Dynamic</b> and the Zyxel Device will allow traffic to be forwarded to the first LAN computer requesting an IP address from the Zyxel Device.   |
|                           | This displays <b>Fixed</b> and the Zyxel Device will allow traffic to be forwarded to a specific LAN computer on the local network of the Zyxel Device.  |
| IP Passthrough            | This displays the IP Passthrough mode.   |
| Mode                      | This displays <b>Dynamic</b> and the Zyxel Device will allow traffic to be forwarded to the first LAN computer requesting an IP address from the Zyxel Device.   |
|                           | This displays <b>Fixed</b> and the Zyxel Device will allow traffic to be forwarded to a specific LAN computer on the local network of the Zyxel Device.  |
| Cellular Status           |  |
| Cellular Status           | This displays the status of the cellular Internet connection.  |
| Data Roaming              | This displays if data roaming is enabled on the Zyxel Device.  |
|                           | Data roaming is to use your Zyxel Device in an area which is not covered by your service provider. Enable roaming to ensure that your Zyxel Device is kept connected to the Internet when you are traveling outside the geographical coverage area of the network to which you are registered. |
| Operator                  | This displays the name of the service provider.  |
| PLMN                      | This displays the PLMN (Public Land Mobile Network) number.  |
| NR-NSA Informati          | ion  |
| MCC                       | This shows the Mobile Country Code (MCC). MCC is a unique code that identifies the country where a Public Land Mobile Network (PLMN) is at.  |

| LABEL                 | DESCRIPTION   |  |  |  |
|-----------------------|---|--|--|--|
| MNC                   | This shows the Mobile Network Code (MNC). MNC is a unique code that identifies a Public Land Mobile Network (PLMN) in a country. MCC and MNC combined together are used to identify a globally unique PLMN.   |  |  |  |
| Service Information   | on  |  |  |  |
|                       | ular service provider supports carrier aggregation (CA), then this section displays for the connection's primary component carrier (PCC).   |  |  |  |
| Access<br>Technology  | This displays the type of the mobile network (such as LTE, UMTS, GSM) to which the Zyxel Device is connecting.  |  |  |  |
| Band                  | This displays the current cellular band of your Zyxel Device (WCDMA2100).   |  |  |  |
| RSSI                  | This displays the strength of the cellular signal between an associated cellular station and the Zyxel Device.  |  |  |  |
| Cell ID               | This shows the cell ID, which is a unique number used to identify the Base Transceiver Station to which the Zyxel Device is connecting.   |  |  |  |
|                       | The value depends on the type of the mobile network (such as LTE, UMTS, GSM) to which the Zyxel Device is connecting:   |  |  |  |
|                       | <ul> <li>For UMTS, it is the Cell Identity as defined in SIB3 3GPP-TS.25.331, 3GPP-TS.24.008.</li> <li>For LTE/5G, it is the 28-bit binary number Cell Identity as specified in SIB1 in 3GPP-TS.36.331.</li> </ul>  |  |  |  |
|                       | The value is '0' (zero) or 'N/A' if there is no network connection.   |  |  |  |
| Physical Cell ID      | This shows the Physical Cell ID (PCI), which are queries and replies between the Zyxel Device and the mobile network it is connecting to. The normal range is 1 to 504.   |  |  |  |
| UL Bandwidth<br>(MHz) | This shows the uplink cellular channel bandwidth from the Zyxel Device to the base station.<br>According to 3GPP specifications, the bandwidths defined by the standard are 1.4, 3, 5, 10, 15, and 20 MHz. The wider the bandwidth the higher the throughput.   |  |  |  |
| DL Bandwidth<br>(MHz) | This shows the downlink cellular channel bandwidth from the base station to the Zyxel Device.<br>According to 3GPP specifications, the bandwidths defined by the standard are 1.4, 3, 5, 10, 15, and 20 MHz. The wider the bandwidth the higher the throughput. |  |  |  |
| RFCN                  | This displays the Radio Frequency Channel Number of DL carrier frequency used by the mobile network to which the Zyxel Device is connecting.  |  |  |  |
|                       | The value depends on the type of the mobile network (such as LTE, UMTS, GSM) to which the Zyxel Device is connecting:   |  |  |  |
|                       | • For UMTS (3G), it is the UARFCN (UTRA Absolute Radio-Frequency Channel Number) as specified in 3GPP-TS.25.101.  |  |  |  |
|                       | <ul> <li>For LTE/5G, it is the EARFCN (E-UTRA Absolute Radio-Frequency Channel Number) as<br/>specified in 3GPP-TS.36.101.</li> </ul>   |  |  |  |
|                       | The value is '0' (zero) or 'N/A' if there is no network connection.   |  |  |  |
| RSRP                  | This displays the Reference Signal Receive Power (RSRP), which is the average received power of all Resource Element (RE) that carry cell-specific Reference Signals (RS) within the specified bandwidth.   |  |  |  |
|                       | The received RSRP level of the connected E-UTRA cell, in dBm, is as specified in 3GPP-TS.36.214.<br>The reporting range is specified in 3GPP-TS.36.133.   |  |  |  |
|                       | An undetectable signal is indicated by the lower limit, example –140 dBm.   |  |  |  |
|                       | This parameter is for LTE only. The normal range is $-44$ to $-140$ . The signal is better when the value is closer to $-44$ . The value is $-140$ if the Current Access Technology is not LTE. The value is 'N/A' if there is no network connection.           |  |  |  |

Table 15 Cellular Info: Detailed Information (continued)

| LABEL | DESCRIPTION  |
|-------|--|
| RSRQ  | This displays the Reference Signal Receive Quality (RSRQ), which is the ratio of RSRP to the E-UTRA carrier RSSI and indicates the quality of the received reference signal.   |
|       | The received RSRQ level of the connected E-UTRA cell, in 0.1 dB, is as specified in 3GPP-TS.36.214. An undetectable signal is indicated by the lower limit, example $-240$ .   |
|       | This parameter is for LTE only. The normal range is –30 to –240. The value is –240 if the Current Access Technology is not LTE. The value is 'N/A' if there is no network connection.  |
| RSCP  | This displays the Received Signal Code Power, which measures the power of channel used by the Zyxel Device.  |
|       | The received signal level, in dBm, is of the CPICH channel (Ref. 3GPP TS 25.133). An undetectable signal is indicated by the lower limit, example $-120$ dBm.  |
|       | This parameter is for UMTS only. The normal range is $-30$ to $-120$ . The value is $-120$ if the Current Access Technology is not UMTS. The value is 'N/A' if there is no network connection.   |
| EcNo  | This displays the ratio (in dB) of the received energy per chip and the interference level.  |
|       | The measured EcNo is in 0.1 dB and is received in the downlink pilot channel. An undetectable signal is indicated by the lower limit, example –240 dB.   |
|       | This parameter is for UMTS only. The normal range is $-30$ to $-240$ . The value is $-240$ if the Current Access Technology is not UMTS or there is no network connection.   |
| TAC   | This displays the Tracking Area Code (TAC), which is used to identify the country of a mobile subscriber.  |
|       | The physical cell ID of the connected E-UTRAN cell, is as specified in 3GPP-TS.36.101.   |
|       | This parameter is for LTE only. The value is '0' (zero) or 'N/A' if the Current Access Technology is not LTE or there is no network connection.  |
| LAC   | This displays the 2-octet Location Area Code (LAC), which is used to identify a location area within a PLMN.   |
|       | The LAC of the connected cell is as defined in SIB 1 [3GPP-TS.25.331]. The concatenation of PLMN ID (MCC+MNC) and LAC uniquely identifies the LAI (Location Area ID) [3GPP-TS.23.003].   |
|       | This parameter is for UMTS or GPRS. The value is '0' (zero) if the Current Access Technology is not UMTS or GPRS. The value is 'N/A' if there is no network connection.  |
| RAC   | This displays the RAC (Routing Area Code), which is used in mobile network "packet domain service" (PS) to identify a routing area within a location area.   |
|       | In a mobile network, the Zyxel Device uses LAC (Location Area Code) to identify the geographical location for the old 3G voice only service, and uses RAC to identify the location of data service like HSDPA or LTE.  |
|       | The RAC of the connected UTRAN cell is as defined in SIB 1 [3GPP-TS.25.331]. The concatenation of PLMN ID (MCC+MNC), LAC, and RAC uniquely identifies the RAI (Routing Area ID) [3GPP-TS.23.003].  |
|       | This parameter is for UMTS or GPRS. The value is '0' (zero) if the Current Access Technology is not UMTS or GPRS. The value is 'N/A' if there is no network connection.  |
| BSIC  | The Base Station Identity Code (BSIC), which is a code used in GSM to uniquely identify a base station.  |
|       | This parameter is for GPRS only. The value is '0' (zero) if the Current Access Technology is not GPRS. The value is 'N/A' if there is no network connection.   |
| SINR  | This displays the Signal to Interference plus Noise Ratio (SINR) in dB. This is also a measure of signal quality and used by the UE (User Equipment) to calculate the Channel Quality Indicator (CQI) that it reports to the network. A negative value means more noise than signal. |
| CQI   | This displays the Channel Quality Indicator (CQI). It is an indicator carrying the information on how good or bad the communication channel quality is.  |

Table 15 Cellular Info: Detailed Information (continued)

| LABEL            | DESCRIPTION  |
|------------------|--|
| MCS              | MCS stands for modulation coding scheme. The base station selects MCS based on current radio conditions. The higher the MCS the more bits can be transmitted per time unit.  |
| RI               | This displays the Rank Indication, one of the control information that a UE will report to eNodeB (Evolved Node-B) on either PUCCH (Physical Uplink Control Channel) or PUSCH (Physical Uplink Shared Channel) based on uplink scheduling. |
| PMI              | This displays the Precoding Matrix Indicator (PMI).  |
|                  | PMI is for transmission modes 4 (closed loop spatial multiplexing), 5 (multi-user MIMO), and 6 (closed loop spatial multiplexing using a single layer).  |
|                  | PMI determines how cellular data are encoded for the antennas to improve downlink rate.  |
| SCC Information  | If the cellular service provider supports carrier aggregation (CA), then this section displays statistics for the connection's secondary component carriers (SCCs).  |
| #                | This displays the ID of the SCC. Some cellular providers support two or more SCCs.   |
| Physical Cell ID | This displays the Physical Cell ID (PCI) of the SCC.   |
| RFCN             | This displays the Radio Frequency Channel Number of DL carrier frequency used by the SCC.  |
| Band             | This displays the current cellular band used by the SCC.   |
| RSSI             | This displays the cellular signal strength between an associated cellular station and the Zyxel Device for this SCC.   |
| RSRP             | This displays the Received Signal Code Power of the SCC.   |
| RSRQ             | This displays the Reference Signal Receive Quality of the SCC.   |
| SINR             | This displays the Signal to Interference plus Noise Ratio (SINR) of the SCC.   |

Table 15 Cellular Info: Detailed Information (continued)

#### 6.1.5 WiFi Settings

Use this screen to enable or disable the main WiFi network. When the switch turns blue, the function is enabled. You can use this screen or the QR code on the upper right corner to check the SSIDs (WiFi network name) and passwords of the main WiFi networks. If you want to show or hide your WiFi passwords, click the Eye icon (1).

| WiFi Settings |                |               |   |  |
|---------------|----------------|---------------|---|--|
| ()<br>2.4G    | 2.4G WiFi Name | WiFi Password |   |  |
|               | Zyxel07147     | ••••          | 0 |  |
| ((( 56        | 5G WiFi Name   | WiFi Password |   |  |
|               | Zyxel07147     | •••••         | 0 |  |
| ((( 0         | 6G WiFi Name   | WiFi Password |   |  |
|               | Zyxel07147     | ••••          | 0 |  |
|               |                |               |   |  |

Click the Arrow icon () to configure the SSIDs and/or passwords for your main WiFi networks. Click the Eye icon () to display the characters as you enter the WiFi Password.

Scanning the QR code is an alternative way to connect your WiFi client to the WiFi network.

| Figure 44 | WiFi Settings: | Configuration         |

| Hide WiFi netwo | rk name i   |        | Hide WiFi netwo | ork name 🔒    |   |

Each field is described in the following table.

| LABEL                     | DESCRIPTION  |
|---------------------------|--|
| 2.4G / 5G / 6G WiFi       | Click this switch to enable or disable the 2.4G / 5G / 6G WiFi network. When the switch turns blue, the function is enabled.   |
| WiFi Name                 | The SSID (Service Set IDentity) identifies the service set with which a WiFi device is associated.<br>WiFi devices associating to the access point (AP) must have the same SSID. |
|                           | Enter a descriptive name for the WiFi. Up to 32 printable ASCII characters are allowed except [ " ], [ ` ], [ ' ], [ < ], [ > ], [ ^ ], [ \$ ], [   ], [ & ], or [ ; ].          |
| WiFi Password             | If you selected <b>Random Password</b> , this field displays a pre-shared key generated by the Zyxel Device.   |
|                           | If you did not select <b>Random Password</b> , you can manually enter a pre-shared key from 8 to 64 case-sensitive keyboard characters.  |
|                           | Click the Eye icon to show or hide the password for your WiFi network. When the Eye icon is slashed Ø, you will see the password in plain text. Otherwise, it is hidden.         |
| Random Password           | Select this to have the Zyxel Device automatically generate a password. The <b>WiFi Password</b> field will not be configurable when you select this option.                     |
| Hide WiFi network<br>name | Select this to hide the SSID in the outgoing beacon frame so a station cannot obtain the SSID through scanning using a site survey tool.   |
|                           | Note: Disable WPS in the <b>Network Setting</b> > <b>Wireless</b> > <b>WPS</b> screen to hide the SSID.  |
| Save                      | Click <b>Save</b> to save your changes.  |

Table 16 WiFi Settings: Configuration

## 6.2 Guest WiFi Settings

Use this screen to enable or disable the guest 2.4 GHz / 5 GHz /6GHz WiFi networks. When the switch goes to the right ( ), the function is enabled. Otherwise, it is not. You can check their SSIDs (WiFi network name) and passwords from this screen. If you want to show or hide your WiFi passwords, click the Eye icon.

| Guest WiFi Settings |                  |               |   |  |
|---------------------|------------------|---------------|---|--|

|   | Save                                  |                        |   |

To assign different SSIDs to the 2.4 GHz and 5 GHz guest wireless networks, clear the Keep 2.4G, 5G and 6G the same check box in the WiFi Settings screen, and the Guest WiFi Settings screen will change.

Each field is described in the following table.

| LABEL                     | DESCRIPTION   |
|---------------------------|---|
| 2.4G/5G/6G WiFi           | Click this switch to enable or disable the 2.4 GHz / 5 GHz / 6GHz WiFi networks. When the switch goes to the right , the function is enabled. Otherwise, it is not.                   |
| WiFi Name                 | The SSID (Service Set IDentity) identifies the service set with which a wireless device is associated. Wireless devices associating to the access point (AP) must have the same SSID. |
|                           | Enter a descriptive name (up to 32 English keyboard characters) for the WiFi.   |
| WiFi Password             | If you selected <b>Random Password</b> , this field displays a pre-shared key generated by the Zyxel Device.  |
|                           | If you did not select <b>Random Password</b> , you can manually enter a pre-shared key from 8 to 64 case-sensitive keyboard characters.   |
|                           | Click the Eye icon to show or hide the password of your WiFi network. When the Eye icon is slashed Ø, you will see the password in plain text. Otherwise, it is hidden.               |
| Random Password           | Select this option to have the Zyxel Device automatically generate a password. The <b>WiFi Password</b> field will not be configurable when you select this option.                   |
| Hide WiFi network<br>name | Select this check box to hide the SSID in the outgoing beacon frame so a station cannot obtain the SSID through scanning using a site survey tool.                                    |
|                           | Note: Disable WPS in the <b>Network Setting</b> > <b>Wireless</b> > <b>WPS</b> screen to hide the SSID.   |
| Save                      | Click <b>Save</b> to save your changes.   |

Table 17 WiFi Settings: Configuration

## 6.2.1 LAN

Use this screen to view the LAN IP address, subnet mask, and DHCP settings of your Zyxel Device. Click the switch button to turn on/off the DHCP server.

| LABEL                     | DESCRIPTION  |
|---------------------------|--|
| DHCP Server<br>Lease Time | This is the period of time a DHCP-assigned address is valid, before it expires.  |
|                           | When a client connects to the Zyxel Device, DHCP automatically assigns the client an IP addresses from the IP address pool. DHCP leases each addresses for a limited period of time, which means that past addresses are "recycled" and made available for future reassignment to other devices. |
| Days/Hours/<br>Minutes    | Enter the lease time of the DHCP server.   |

Table 18 LAN Setup (continued)

## CHAPTER 7 Broadband

## 7.1 Broadband Overview

This chapter discusses the Zyxel Device's **Broadband** screens. Use these screens to configure your Zyxel Device for Internet access.

A WAN (Wide Area Network) connection is an outside connection to another network or the Internet. It connects your private networks, such as a LAN (Local Area Network) and other networks, so that a computer in one location can communicate with computers in other locations.

Figure 50 LAN and WAN

## 7.1.1 What You Can Do in this Chapter

- Use the **Broadband** screen to view a WAN interface. You can also configure the WAN settings on the Zyxel Device for Internet access (Section 7.2 on page 100).
- Use the **WAN Backup** screen to configure your Zyxel Device's WAN backup settings (Section 7.4 on page 106).
- Use the **Ethernet WAN** screen to convert LAN port number four as a WAN port or restore the Ethernet WAN port to a LAN port (Section 7.4 on page 106).
- Use the Cellular WAN screen to configure a cellular WAN connection (Section 7.5 on page 106).
- Use the Cellular APN screen to configure the APN setting (Section 7.6 on page 107).
- Use the Cellular SIM screen to enter the PIN of your SIM card (Section 7.7 on page 112).
- Use the **Cellular Band** screen to view or edit a cellular WAN interface. You can also configure the WAN settings on the Zyxel Device for Internet access (Section 7.8 on page 113).
- Use the **Cellular PLMN** screen to display available Public Land Mobile Networks (Section 7.9 on page 113).
- Use the **Cellular IP Passthrough** screen to configure a cellular WAN connection (Section 7.10 on page 116).

99

• Use the **Cellular SMS** screen to send and receive SMS messages from the Zyxel Device (Section 7.11 on page 117).

| LAYER-2 INTERF | ACE           | INTERNET CONNECTION |               |  |  |  |
|----------------|---------------|---------------------|---------------|--|--|--|
| CONNECTION     | DSL LINK TYPE | MODE                | ENCAPSULATION | CONNECTION SETTINGS  |  |  |
| Ethernet       | N/A           | Routing             | IPoE          | WAN IPv4/IPv6 IP address, NAT, DNS server and routing feature. |  |  |

Table 19 WAN Setup Overview

## 7.1.2 What You Need to Know

The following terms and concepts may help as you read this chapter.

#### WAN IP Address

The WAN IP address is an IP address for the Zyxel Device, which makes it accessible from an outside network. It is used by the Zyxel Device to communicate with other devices in other networks. The ISP dynamically assigns it each time the Zyxel Device tries to access the Internet.

#### APN

An Access Point Name (APN) is the name of a gateway between a cellular network and another network, such as the Internet. The Zyxel Device requires an APN to connect to a cellular network. Different APNs may provide different services, such as Internet access or MMS (Multi-Media Messaging Service), and different charging methods.

## 7.1.3 Before You Begin

You may need to know your Internet access settings such as APN, WAN IP address and SIM card's PIN code if the **INTERNET** light on your Zyxel Device is off. Get this information from your service provider.

## 7.2 Broadband

Use this screen to change your Zyxel Device's Internet access settings. The summary table shows you the configured WAN services (connections) on the Zyxel Device. Use information provided by your ISP to configure WAN settings.

Click **Network Setting > Broadband** to access this screen.

#### Figure 51 Network Setting > Broadband

The following table describes the labels in this screen.

#### Table 20 Network Setting > Broadband

| LABEL              | DESCRIPTION  |
|--------------------|--|
| #                  | This is the index number of the entry.   |
| Name               | This is the service name of the connection.  |
| Туре               | This shows whether it is a cellular or Ethernet connection.  |
| Mode               | This shows the connection is in routing mode.  |
| Encapsulation      | This is the method of encapsulation used by this connection.   |
| 802.1p             | This indicates the 802.1p priority level assigned to traffic sent through this connection. This displays <b>N/A</b> when there is no priority level assigned.      |
| 802.1q             | This indicates the VLAN ID number assigned to traffic sent through this connection. This displays <b>N/A</b> when there is no VLAN ID number assigned.             |
| IGMP Proxy         | This shows whether the Zyxel Device act as an IGMP proxy on this connection.   |
| NAT                | This shows whether NAT is activated or not for this connection.  |
| Default<br>Gateway | This shows whether the Zyxel Device use the WAN interface of this connection as the default gateway.   |
| IPv6               | This shows whether IPv6 is activated or not for this connection. IPv6 is not available when the connection uses the bridging service.                              |
| MLD Proxy          | This shows whether Multicast Listener Discovery (MLD) is activated or not for this connection. MLD is not available when the connection uses the bridging service. |
| Modify             | Click the Modify icon to configure the WAN connection.   |
|                    | Click the <b>Delete</b> icon to remove the WAN connection.   |

## 7.2.1 Add or Edit Internet Connection

Click the **Edit** or **Modify** icon next to a WAN interface to open the following screen. Use this screen to configure a WAN connection.

|                   | Edit W                      | AN Interface        |   |           |

Figure 52 Network Setting > Broadband > Add or Edit New WAN Interface

The following table describes the labels in this screen.

| LABEL         | DESCRIPTION  |  |
|---------------|--|--|
| General       | Click this switch to enable or disable the WAN interface.  |  |
| Name          | This is the service name of the connection.  |  |
| Туре          | This shows the type of the connection the Zyxel Device is currently associated with.   |  |
| Mode          | This shows the connection is in <b>Routing</b> or <b>Bridge</b> mode.<br>If the Zyxel Device is in routing mode, your ISP gives you one IP address only and you want<br>multiple computers to share an Internet account. |  |
| Encapsulation | This is the method of encapsulation used by this connection.   |  |

Table 21 Network Setting > Broadband > Add or Edit New WAN Interface

| LABEL                                    | DESCRIPTION   |  |
|--|---|--|
| IPv4/IPv6 Mode                           | This shows IPv4 IPv6 DualStack.   |  |
|  | IPv4 IPv6 DualStack allows the Zyxel Device to run IPv4 and IPv6 at the same time.  |  |
| VLAN                                     | Click this switch to enable or disable VLAN on this WAN interface.  |  |
| 802.1p                                   | IEEE 802.1p defines up to 8 separate traffic types by inserting a tag into a MAC-layer frame that contains bits to define class of service.   |  |
|  | Select the IEEE 802.1p priority level (from 0 to 7) to add to traffic through this connection. The greater the number, the higher the priority level.   |  |
| 802.1q                                   | Enter the VLAN ID number (from 1 to 4094) for traffic through this connection.  |  |
| MTU                                      |   |  |
| MTU                                      | Enter the MTU (Maximum Transfer Unit) size for this traffic.  |  |
| IP Address                               |   |  |
| Obtain an IP<br>Address<br>Automatically | A static IP address is a fixed IP that your ISP gives you. A dynamic IP address is not fixed; the ISP assigns you a different one each time you connect to the Internet. Select this if you have a dynamic IP address.  |  |
| Static IP Address                        | Select this option If the ISP assigned a fixed IP address.  |  |
| IP Address                               | Enter the static IP address provided by your ISP.   |  |
| Subnet Mask                              | Enter the subnet mask provided by your ISP.   |  |
| Gateway IP<br>Address                    | Enter the gateway IP address provided by your ISP.  |  |
| DNS Server                               |   |  |
|  | Select <b>Obtain DNS Info Automatically</b> if you want the Zyxel Device to use the DNS server addresses assigned by your ISP.  |  |
|  | Select <b>Use Following Static DNS Address</b> if you want the Zyxel Device to use the DNS server addresses you configure manually.   |  |
| Primary DNS<br>Server                    | Enter the first DNS server address assigned by the ISP.   |  |
| Secondary DNS<br>Server                  | Enter the second DNS server address assigned by the ISP.  |  |
| Routing Feature                          |   |  |
| NAT                                      | Click this switch to activate or deactivate NAT on this connection.   |  |
| IGMP Proxy                               | Internet Group Multicast Protocol (IGMP) is a network-layer protocol used to establish membership in a Multicast group – it is not used to carry user data.   |  |
|  | Click this switch to have the Zyxel Device act as an IGMP proxy on this connection.   |  |
|  | This allows the Zyxel Device to get subscribing information and maintain a joined member list for each multicast group. It can reduce multicast traffic significantly.  |  |
| Apply as Default<br>Gateway              | Click this switch to enable the Zyxel Device to use the WAN interface of this connection as the system default gateway.   |  |
| Fullcone NAT                             | Click this switch to enable or disable fullcone NAT on this connection.   |  |
|  | This field is available only when you activate <b>NAT</b> .   |  |
|  | In fullcone NAT, the Zyxel Device maps all outgoing packets from an internal IP address and port<br>to a single IP address and port on the external network. The Zyxel Device also maps packets<br>coming to that external IP address and port to the internal IP address and port. |  |
| DHCPC Options                            |   |  |

 Network Setting > Broadband > Add or Edit New WAN Interface (continued)

| LABEL                                       | DESCRIPTION  |  |
|---|--|--|
| Request Options                             | Select <b>Option 43</b> to have the Zyxel Device get vendor specific information from DHCP packets<br>sent from the DHCP server.<br>Select <b>Option 120</b> to have the Zyxel Device get an IP address or a fully-qualified domain name of<br>a SIP server from DHCP packets sent from the DHCP server.<br>Select <b>Option 121</b> to have the Zyxel Device get static route information from DHCP packets sent<br>from the DHCP server. |  |
| Sent Options                                |  |  |
| option 60                                   | Select this and enter the device identity you want the Zyxel Device to add in the DHCP discovery packets that go to the DHCP server.   |  |
| Vendor ID                                   | Enter the Vendor Class Identifier, such as the type of the hardware or firmware.   |  |
| option 61                                   | Select this and enter any string that identifies the device.   |  |
| IAID  | Enter the Identity Association Identifier (IAID) of the device, for example, the WAN connection index number.  |  |
| DUID  | Enter the hardware type, a time value and the MAC address of the device.   |  |
| option 125                                  | Select this to have the Zyxel Device automatically generate and add vendor specific parameters in the DHCP discovery packets that go to the DHCP server.   |  |
| IPv6 Address                                |  |  |
| Obtain an IPv6<br>Address<br>Automatically  | Select <b>Obtain an IPv6 Address Automatically</b> if you want to have the Zyxel Device use the IPv6 prefix from the connected router's Router Advertisement (RA) to generate an IPv6 address.   |  |
| Static IPv6<br>Address                      | Select Static IPv6 Address if you have a fixed IPv6 address assigned by your ISP. When you select this, the following fields appear.   |  |
| IPv6 Address                                | Enter an IPv6 IP address that your ISP gave to you for this WAN interface.   |  |
| Prefix Length                               | Enter the address prefix length to specify how many most significant bits in an IPv6 address compose the network address.  |  |
| IPv6 Default<br>Gateway                     | Enter the IP address of the next-hop gateway. The gateway is a router or switch on the same segment as your Zyxel Device's interfaces. The gateway helps forward packets to their destinations.  |  |
| IPv6 DNS Server                             |  |  |
| Obtain IPv6 DNS<br>Info<br>Automatically    | Select <b>Obtain IPv6 DNS Info Automatically</b> to have the Zyxel Device get the IPv6 DNS server addresses from the ISP automatically.  |  |
| Use Following<br>Static IPv6 DNS<br>Address | Select Use Following Static IPv6 DNS Address to have the Zyxel Device use the IPv6 DNS server addresses you configure manually.  |  |
| Primary DNS<br>Server                       | Enter the first IPv6 DNS server address assigned by the ISP.   |  |
| Secondary DNS<br>Server                     | Enter the second IPv6 DNS server address assigned by the ISP.  |  |
| IPv6 Routing Feat                           | ure  |  |
| MLD Proxy<br>Enable                         | Select this check box or option to have the Zyxel Device act as an MLD proxy on this connection.<br>This allows the Zyxel Device to get subscription information and maintain a joined member list for<br>each multicast group. It can reduce multicast traffic significantly.   |  |
| Apply as Default<br>Gateway                 | Select this option to have the Zyxel Device use the WAN interface of this connection as the system default gateway.  |  |
| Cancel                                      | Click <b>Cancel</b> to exit this screen without saving.  |  |
| Apply                                       | Click Apply to save your changes.  |  |

Table 21 Network Setting > Broadband > Add or Edit New WAN Interface (continued)

## 7.3 WAN Backup

Use this screen to configure your Zyxel Device's Internet settings if the wired connection is down. You can use an alternative network, and assign an IP address to verify the accessibility of the Internet and the time interval allowed between each connection check.

Click Network Setting > Broadband > WAN Backup to display the following screen.

Note: This feature is only available if Ethernet WAN > State is enabled.

| Figure 53 | Network Setting > | Broadband >  | WAN Backup   |

| The Destination for<br>Connection Check | Google DNS •   |                            |  |
| Connection Check Interval               | 60   | (30~600 secs)              |  |
| Check Fail Limit                        | 3  | (1~10 times)               |  |
|   | Cancel Apply   |                            |  |

The following table describes the fields in this screen.

| LABEL                                   | DESCRIPTION   |
|---|---|
| WAN Backup Enable                       | Select Enable to have the Zyxel Device use the cellular connection as your WAN or a backup when the wired WAN connection fails.   |
| Primary WAN                             | This field displays the connection the Zyxel Device would use first when the wired WAN connection fails. You can choose <b>Ethernet</b> or <b>Cellular</b> as the primary WAN connection for your Zyxel Device.   |
| The Destination for<br>Connection Check | Configure this field to test your Zyxel Device's WAN accessibility. Enter the IP address<br>of a reliable nearby computer (for example, your ISP's DNS server address).<br>Note: If you activate either traffic redirect or dial backup, you must<br>configure at least one IP address here. When using a WAN backup<br>connection, the Zyxel Device periodically pings the addresses<br>configured here and uses the other WAN backup connection (if<br>configured) if there is no response. |
| Connection Check Interval               | When the Zyxel Device is using a lower priority connection (usually a WAN backup connection), it periodically checks to whether or not it can use a higher priority connection. Enter the number of seconds (30 recommended) for the Zyxel Device to wait between checks. Allow more time if your destination IP address handles lots of traffic.   |

Table 22 Network Setting > Broadband > WAN Backup

| LABEL            | DESCRIPTION  |
|------------------|--|
| Check Fail Limit | Enter the number of times that your Zyxel Device will ping the IP addresses configured in the <b>Destination for Connection Check</b> field without getting a response before switching to a WAN backup connection (or a different WAN backup connection). |
| Cancel           | Click <b>Cancel</b> to exit this screen without saving.  |
| Apply            | Click <b>Apply</b> to save your changes.   |

Table 22 Network Setting > Broadband > WAN Backup (continued)

## 7.4 Ethernet WAN

Use this screen to have a LAN port act as an Ethernet WAN port. When the switch goes to the right, the LAN port acts as an Ethernet WAN port. Otherwise, the LAN port remains as a LAN port. Click **Apply** to save your changes back to the Zyxel Device.

Click Network Setting > Broadband > Ethernet WAN to display the following screen.

Figure 54 Network Setting > Broadband > Ethernet WAN

| Broadband   |  |  |
|---|--|--|
| Broadband Ethernet WAN Cellular WAN Cellular SIM Cellular Band Cellular PLMN                                    |  |  |
| You can convert Ethernet LAN port 4 to Ethernet WAN port or restore the WAN port to LAN port.                   |  |  |
| State:  |  |  |
| Note  |  |  |
| (1) Active Enable, the Ethernet Port is WAN Ethernet.   |  |  |
| (2) Active Disable, the Ethernet Port is LAN Ethernet.  |  |  |
| (3) If Ethernet WAN cable and Cellular interface is connected at the same time, only Ethernet WAN will link up. |  |  |
| Cancel Apply  |  |  |

## 7.5 Cellular WAN

Click **Network Setting** > **Broadband** > **Cellular WAN** to display the following screen. Use this screen to enable data roaming and network monitoring when the Zyxel Device cannot ping a base station.

Note: Roaming charges may apply when Data Roaming is enabled.

| Enable              | Click this switch to enable the Access Point Name (APN) on the Zyxel Device  |
| APN Manual Mode     | Disable this switch to have the Zyxel Device configure the APN of a cellular network automatically. Otherwise, Click this switch to enable and enter the APN manually in the field below.  |
| APN                 | This field allows you to display the APN in the profile.   |
|                     | Enter the APN provided by your service provider. Connections with different APNs may provide different services (such as Internet access or MMS (Multi-Media Messaging Service)) and charging method.  |
|                     | You can enter up to 64 printable ASCII characters. Spaces are allowed.   |
| Username            | Enter the user name. You can enter up to 64 printable ASCII characters. Spaces are allowed.  |
| Password            | Enter the password associated with the user name above. You can enter up to 64 printable ASCII characters. Spaces are allowed.   |
| Authentication Type | Select the type of authentication method peers use to connect to the Zyxel Device in cellular connections.   |
|                     | In Password Authentication Protocol (PAP) peers identify themselves with a user<br>name and password. In Challenge Handshake Authentication Protocol (CHAP)<br>additionally to user name and password the Zyxel Device sends regular challenges<br>to make sure an intruder has not replaced a peer. Otherwise select PAP/CHAP or<br>None. |
| PDP Type            | Select IPv4 if you want the Zyxel Device to run IPv4 (Internet Protocol version 4 addressing system) only.   |
|                     | Select <b>IPv4/IPv6</b> if you want the Zyxel Device to run both IPv4 and IPv6 (Internet Protocol version 4 and 6 addressing system) at the same time.   |
| OK                  | Click <b>OK</b> to save your changes.  |
| Cancel              | Click <b>Cancel</b> to return to the previous screen without saving.   |

| Table 25 | Network Setting > | Broadband > Cellular APN > Edit APN |
|----------|-------------------|-------------------------------------|

### 7.6.2 Using Separate APNs for Data and Management Traffic

Multiple APN Access allows a cellular device to open data sessions with two or more APNs, and then send data through the APNs simultaneously. If your cellular service provider supports Multiple APN Access, the Zyxel Device can use this feature to segregate cellular traffic.

Follow the steps below to configure the Zyxel Device to use separate APNs for data and management traffic.

1 At Network Setting > Broadband > Cellular APN, ensure that the Zyxel Device is connected to two dataenabled APNs. If your cellular service provider supports this feature, the Zyxel Device will connect to two APNs automatically.

|        | and Ethernet W<br>IP Passthrough |                     | /AN Cellular /   | APN Cellular SIM C      | Cellular Band Cellul  | ar PLMN |

# 7.7 Cellular SIM Configuration

Use this screen to enter a PIN for your SIM card, in order to prevent others from using it.

# Entering the wrong PIN code 3 consecutive times locks the SIM card, after which you need a PUK (Personal Unlocking Key) from the service provider to unlock it.

Click Network Setting > Broadband > Cellular SIM. The following screen opens.

| Enter a PIN for your SIM             | A card to prevent others from using it. |   |
|--------------------------------------|---|---|
| PIN Management                       |   |   |
| PIN Protection                       | <b>C</b>                                |   |
| PIN                                  |   | 0 |
|                                      | Attempts remaining; 2                   |   |
|                                      |   |   |
| ∎Note                                |   |   |
| ■ Note<br>(1) The PIN is automatical | lly saved in the Zyxel Device.          |   |

Figure 59 Network Setting > Broadband > Cellular SIM

Note: The PIN is automatically saved in the Zyxel Device.

Entering the wrong PIN exceeding a set number of times will lock the SIM card.

# Chapter 8 Wireless

# 8.1 Wireless Overview

This chapter describes the Zyxel Device's **Network Setting** > **Wireless** screens. Use these screens to set up your Zyxel Device's WiFi network and security settings.

### 8.1.1 What You Can Do in this Chapter

This section describes the Zyxel Device's **Wireless** screens. Use these screens to set up your Zyxel Device's WiFi connection.

- Use the **General** screen to enable the Wireless LAN, enter the SSID and select the WiFi security mode (Section 8.2 on page 120)
- Use the Guest/More AP screen to set up multiple WiFi networks on your Zyxel Device (Section 8.3 on page 125).
- Use the MAC Authentication screen to allow or deny WiFi clients based on their MAC addresses from connecting to the Zyxel Device (Section 8.4 on page 127).
- Use the **WPS** screen to enable or disable WPS, view or generate a security PIN (Personal Identification Number) (Section 8.5 on page 128).
- Use the **WMM** screen to enable WiFi MultiMedia (WMM) to ensure quality of service in WiFi networks for multimedia applications (Section 8.6 on page 130).
- Use the **Others** screen to configure WiFi advanced features, such as the RTS/CTS Threshold (Section 8.7 on page 131).
- Use the WLAN Scheduler screen to create rules to schedule the times to permit Internet traffic from each wireless network interfaces (Section 8.8 on page 133).
- Use the **Channel Status** screen to scan the number of accessing points and view the results (Section 8.9 on page 135).
- Use the **EasyMesh** screen to enable to disable Easy Mesh Controller on your Zyxel Device (Section 8.10 on page 137).

### 8.1.2 What You Need to Know

#### **Wireless Basics**

"Wireless" is essentially radio communication. In the same way that walkie-talkie radios send and receive information over the airwaves, wireless networking devices exchange information with one another. A wireless networking device is just like a radio that lets your computer exchange information with radios attached to other computers. Like walkie-talkies, most wireless networking devices operate at radio frequency bands that are open to the public and do not require a license to use. However, wireless networking is different from that of most traditional radio communications in that there are a number of wireless networking standards available with different methods of data encryption.

#### **Finding Out More**

See Section 8.11 on page 137 for advanced technical information on WiFi networks.

# 8.2 Wireless General Settings

Use this screen to enable the WiFi, enter the SSID and select the WiFi security mode. We recommend that you select **More Secure** to enable **WPA3-SAE** data encryption.

Note: If you are configuring the Zyxel Device from a computer connected by WiFi and you change the Zyxel Device's SSID, channel or security settings, you will lose your WiFi connection when you press **Apply**. You must change the WiFi settings of your computer to match the new settings on the Zyxel Device.

Click Network Setting > Wireless to open the General screen.

Figure 68 Network Setting > Wireless > General

The following table describes the general WiFi labels in this screen.

| Table 33 | Network Setting > | Wireless > General |
|----------|-------------------|--------------------|
|----------|-------------------|--------------------|

| LABEL             | DESCRIPTION  |
|-------------------|--|
| Wireless/WiFi Net | work Setup   |
| Band              | This shows the WiFi band which this radio profile is using. <b>2.4GHz</b> is the frequency used by IEEE 802.11b/g/n/ax WiFi clients, <b>5GHz</b> is used by IEEE 802.11a/n/ac/ax WiFi clients.                   |
| Wireless/WiFi     | Click this switch to enable or disable WiFi in this field. When the switch turns blue, the function is enabled. Otherwise, it is not.  |
| Channel           | Select a channel from the drop-down list box. The options vary depending on the frequency band and the country you are in.<br>Use <b>Auto</b> to have the Zyxel Device automatically determine a channel to use. |

| LABEL                           | DESCRIPTION   |
|---------------------------------|---|
| Bandwidth                       | A standard 20 MHz channel offers transfer speeds of up to 150 Mbps whereas a 40 MHz channel uses two standard channels and offers speeds of up to 300 Mbps.   |
|                                 | 40 MHz (channel bonding or dual channel) bonds two adjacent radio channels to increase throughput. The WiFi clients must also support 40 MHz. It is often better to use the 20 MHz setting in a location where the environment hinders the WiFi signal.                               |
|                                 | An 80 MHz channel groups adjacent 40 MHz channels into pairs to increase bandwidth even higher.   |
|                                 | Select <b>20MHz</b> if you want to lessen radio interference with other wireless devices in your neighborhood or the WiFi clients do not support channel bonding.   |
|                                 | Because not all devices support 40 MHz and/or 160 MHz channels, select <b>20/40MHz</b> or <b>20/40/80/</b><br><b>160MHz</b> to allow the Zyxel Device to adjust the channel bandwidth automatically.  |
| Control<br>Sideband             | This is available for some regions when you select a specific channel and set the <b>Bandwidth</b> field to <b>40MHz</b> or <b>20/40MHz</b> . Set whether the control channel (set in the <b>Channel</b> field) should be in the <b>Lower</b> or <b>Upper</b> range of channel bands. |
| Wireless/WiFi Net               | work Settings   |
| Wireless/WiFi<br>Network Name   | The SSID (Service Set IDentity) identifies the service set with which a wireless device is associated. Wireless devices associating to the access point (AP) must have the same SSID.   |
|                                 | Enter a descriptive name for this WiFi network. Up to 32 printable ASCII characters are allowed except ["], [`], [`] or [\$].   |
| Max Clients                     | Specify the maximum number of clients that can connect to this network at the same time.  |
| Hide SSID                       | Select this check box to hide the SSID in the outgoing beacon frame so a station cannot obtain the SSID through scanning using a site survey tool.  |
|                                 | This check box is grayed out if the WPS function is enabled in the <b>Network Setting</b> > <b>Wireless</b> > <b>WPS</b> screen.  |
| Multicast<br>Forwarding         | Select this check box to allow the Zyxel Device to convert wireless multicast traffic into wireless unicast traffic.  |
| Max. Upstream<br>Bandwidth      | Max. Upstream Bandwidth allows you to specify the maximum rate for upstream wireless traffic to the WAN from this wireless LAN in kilobits per second (Kbps).   |
| Max.<br>Downstream<br>Bandwidth | Max. Upstream Bandwidth allows you to specify the maximum rate for downstream wireless traffic to this wireless LAN from the WAN in kilobits per second (Kbps).   |
| BSSID                           | This shows the MAC address of the wireless interface on the Zyxel Device when WiFi is enabled.  |
| Security Level                  | ·   |
| Security Mode                   | Select <b>More Secure (Recommended)</b> to add security on this WiFi network. The WiFi clients which want to associate to this network must have same WiFi security settings as the Zyxel Device. When you select to use a security, additional options appears in this screen.       |
|                                 | Or you can select <b>No Security</b> to allow any client to associate this network without any data encryption or authentication.   |
|                                 | See the following sections for more details about this field.   |
| Cancel                          | Click <b>Cancel</b> to restore your previously saved settings.  |
| Apply                           | Click Apply to save your changes.   |

 Table 33
 Network Setting > Wireless > General (continued)

## 8.2.1 No Security

Select **No Security** to allow wireless stations to communicate with the access points without any data encryption or authentication.

Note: If you do not enable any WiFi security on your Zyxel Device, your network is accessible to any wireless networking device that is within range.

The following table describes the labels in this screen.

Table 34 Wireless > General: No Security

| LABEL          | DESCRIPTION   |
|----------------|---|
| Security Level | Choose No Security to allow all WiFi connections without data encryption or authentication. |

### 8.2.2 More Secure (Recommended)

The WPA-PSK (WiFi Protected Access-Pre-Shared Key) security mode provides both improved data encryption and user authentication over WEP. Using a pre-shared key, both the Zyxel Device and the connecting client share a common password in order to validate the connection. This type of encryption, while robust, is not as strong as WPA, WPA2 or even WPA2-PSK. The WPA2-PSK security mode is a more robust version of the WPA encryption standard. It offers better security, although the use of PSK makes it less robust than it could be.

The WPA3-SAE (Simultaneous Authentication of Equals handshake) security mode protects against dictionary attacks (password guessing attempts). It improves security by requiring a new encryption key every time a WPA3 connection is made. A handshake is the communication between the Zyxel Device and a connecting client at the beginning of a WiFi session.

Click Network Setting > Wireless to display the General screen. Select More Secure as the security level. Then select WPA3-SAE from the Security Mode list if your WiFi client supports it. If you are not sure, select WPA3-SAE/WPA2-PSK or WPA2-PSK.

|                                       | The password has two uses.  |  |  |
|                                       | <ol> <li>Manual. Manually enter the same password on the Zyxel Device and the client. Enter 8 – 63<br/>ASCII characters or exactly 64 hexadecimal ('0 – 9', 'a – f') characters.</li> </ol> |  |  |
|                                       | 2. WPS. When using WPS, the Zyxel Device sends this password to the client.   |  |  |
|                                       | Note: More than 63 hexadecimal characters are not accepted for WPS.   |  |  |
|                                       | Click the Eye icon to show or hide the password for your wireless network. When the Eye icon is slashed Ø, you'll see the password in plain text. Otherwise, it is hidden.                  |  |  |
| Strength                              | This displays the current password strength – weak, medium, strong.   |  |  |
| Click this 🔶 to s                     | how more fields in this section. Click this 🗡 to hide them.   |  |  |
| Encryption                            | AES is the default data encryption type, which uses a 128-bit key.  |  |  |
|                                       | Select the encryption type (AES or TKIP+AES) for data encryption.   |  |  |
|                                       | Select <b>AES</b> if your WiFi clients can all use AES.   |  |  |
|                                       | Select <b>TKIP+AES</b> to allow the WiFi clients to use either TKIP or AES.   |  |  |
|                                       | Note: Not all models support <b>TKIP+AES</b> encryption.  |  |  |
| Timer                                 | This is the rate at which the RADIUS server sends a new group key out to all clients.   |  |  |

Table 35 Wireless > General: More Secure: WPA3-SAE/WPA2-PSK

# 8.3 Guest/More AP Screen

Use this screen to configure a guest WiFi network that allows access to the Internet through the Zyxel Device. You can use one access point to provide several BSSs simultaneously. You can then assign varying security types to different SSIDs. WiFi clients can use different SSIDs to associate with the same access point.

#### Click Network Setting > Wireless > Guest/More AP.

The following table introduces the supported WiFi networks.

| WIFI NETWORKS WHERE TO CONFIGURE                   |   |
|--|---|
| Main/1 Network Setting > Wireless > General screen |   |
| Guest/3  | Network Setting > Wireless > Guest/More AP screen |

Table 36 Supported WiFi Networks

The following screen displays.

#### Figure 71 Network Setting > Wireless > Guest/More AP

The following table describes the labels in this screen.

#### Table 37 Network Setting > Wireless > Guest/More AP

| LABEL      | DESCRIPTION  |  |
|------------|--|--|
| #          | This is the index number of the entry.   |  |
| Status     | This field indicates whether this SSID is active. A yellow bulb signifies that this SSID is active, while a gray bulb signifies that this SSID is not active.                                  |  |
| SSID       | An SSID profile is the set of parameters relating to one of the Zyxel Device's BSSs. The SSID (Service Set IDentifier) identifies the Service Set with which a wireless device is associated.  |  |
|            | This field displays the name of the WiFi profile on the network. When a WiFi client scans for an AP to associate with, this is the name that is broadcast and seen in the WiFi client utility. |  |
| Security   | This field indicates the security mode of the SSID profile.  |  |
| Guest WLAN | This displays if the guest WLAN function has been enabled for this WLAN.   |  |
|            | If Home Guest displays, clients can connect to each other directly.  |  |
|            | If External Guest displays, clients are blocked from connecting to each other directly.  |  |
|            | N/A displays if guest WLAN is disabled.  |  |
| Modify     | Click the Edit icon of an SSID profile to configure the SSID profile.  |  |

### 8.3.1 The Edit Guest/More AP Screen

Use this screen to create Guest and additional WiFi networks with different security settings.

Note: If upstream/downstream bandwidth is empty, the Zyxel Device sets the value automatically. Setting a maximum upstream/downstream bandwidth will significantly decrease WiFi performance.

Click the Edit icon next to an SSID in the Guest/More AP screen. The following screen displays.

Figure 72 Network Setting > Wireless > More AP > Edit

# 8.4 MAC Authentication

Use this screen to give exclusive access to specific connected devices (Allow) or exclude specific devices from accessing the Zyxel Device (Deny), based on the MAC address of each connected device. Every Ethernet device has a unique factory-assigned MAC (Media Access Control) address, which consists of six pairs of hexadecimal characters, for example: 00:A0:C5:00:00:02. You need to know the MAC addresses of the connected device you want to allow/deny to configure this screen.

Note: You can have up to 25 MAC authentication rules.

Use this screen to view your Zyxel Device's MAC filter settings and add new MAC filter rules. Click **Network Setting** > **Wireless** > **MAC Authentication**. The screen appears as shown.

| General           |                           |                       |
|-------------------|---------------------------|-----------------------|
| SSID              | Zyxel_1DF1 🔹              |                       |

| Apply       | Click <b>Apply</b> to save your changes.  |  |  |  |  |

Table 38 Network Setting > Wireless > MAC Authentication (continued)

# 8.5 WPS

Use this screen to configure WiFi Protected Setup (WPS) on your Zyxel Device.

WiFi Protected Setup (WPS) allows you to quickly set up a WiFi network with strong security, without having to configure security settings manually. Select one of the WPS methods and follow the instructions to establish a WPS connection. Your WiFi devices must support WPS to use this feature. We recommend using Push Button Configuration (**PBC**) if your WiFi device supports it. See Section 8.11.8.1 on page 143 for more information about WPS.

- Note: The Zyxel Device applies the security settings of the main SSID (SSID1) profile to the WPS WiFi connection (see Section 8.2.2 on page 123).
- Note: The WPS switch is unavailable if the WiFi is disabled. If WPS is enabled, UPnP will automatically be turned on.

Click **Network Setting** > **Wireless** > **WPS**. The following screen displays. Click this switch and it will turn blue. Click **Apply** to activate the WPS function. Then you can configure the WPS settings in this screen.

| LABEL           | DESCRIPTION   |  |  |
|-----------------|---|--|--|
| General         |   |  |  |
| WPS             | Slide this to the right to enable and have the Zyxel Device activate WPS. Otherwise, it is disabled.  |  |  |
| Add a new devic | e with WPS Method   |  |  |
| Method 1 PBC    | Use this section to set up a WPS WiFi network using Push Button Configuration (PBC). Click this switch to make it turn blue. Click <b>Apply</b> to activate WPS method 1 on the Zyxel Device.   |  |  |
| WPS             | Click this button to add another WPS-enabled WiFi device (within WiFi range of the Zyxel<br>Device) to your WiFi network. This button may either be a physical button on the outside of a<br>WiFi device, or a menu button similar to the <b>WPS button</b> on this screen.<br>Note: You must press the other WiFi device's WPS button within 2 minutes of pressing |  |  |
|                 | this button.  |  |  |
| Method 2 PIN    | Use this section to set up a WPS WiFi network by entering the PIN of the client into the Zyxel Device. Click this switch to make it turn blue. Click <b>Apply</b> to activate WPS method 2 on the Zyxel Device.   |  |  |
| Register        | Enter the PIN of the WiFi device that you are setting up a WPS connection with and click <b>Register</b> to authenticate and add the WiFi device to your WiFi network.  |  |  |
|                 | You can find the PIN either on the outside of the WiFi device, or by checking the WiFi device's settings.   |  |  |
|                 | Note: You must also activate WPS on that WiFi device within 2 minutes to have it present its PIN to the Zyxel Device.   |  |  |

| Table 39 | Network Setting > | Wireless > WPS (d | continued) |
|----------|-------------------|-------------------|------------|
|----------|-------------------|-------------------|------------|

| LABEL                    | DESCRIPTION   |
|--------------------------|---|
| Method 3                 | Use this section to set up a WPS WiFi network by entering the PIN of the Zyxel Device into the client. Click this switch to make it turn blue. Click <b>Apply</b> to activate WPS method 3 on the Zyxel Device. |
| Release<br>Configuration | The default WPS status is <b>configured</b> .   |
| Configuration            | Click this button to remove all configured WiFi and WiFi security settings for WPS connections on the Zyxel Device.   |
| Generate<br>New PIN      | If this method has been enabled, the PIN (Personal Identification Number) of the Zyxel Device is shown here. Enter this PIN in the configuration utility of the WiFi device you want to connect to using WPS.   |
|                          | The PIN is not necessary when you use the WPS push-button method.   |
|                          | Click the Generate New PIN button to have the Zyxel Device create a new PIN.  |
| Cancel                   | Click <b>Cancel</b> to restore your previously saved settings.  |
| Apply                    | Click <b>Apply</b> to save your changes.  |

# 8.6 WMM

Use this screen to enable WiFi MultiMedia (WMM) and WMM Automatic Power Save Delivery (APSD) in WiFi networks for multimedia applications. WMM enhances data transmission quality, while APSD improves power management of WiFi clients. This allows time-sensitive applications, such as voice and videos, to run more smoothly.

Click Network Setting > Wireless > WMM to display the following screen.

Figure 75 Network Setting > Wireless > WMM

Note: WMM cannot be disabled if 802.11 mode includes 802.11n or 802.11ac.

Note: APSD only affects SSID1. For SSID2-SSID4, APSD is always enabled.

| LABEL   | DESCRIPTION  |
|---|--|
| WMM of SSID                                       | Select <b>On</b> to have the Zyxel Device automatically give the WiFi network (SSIDx) a priority level according to the ToS value in the IP header of packets it sends. WMM QoS (WiFi MultiMedia Quality of Service) gives high priority to video, which makes them run more smoothly.   |
|   | SSID1 is the General WiFi SSID; SSID2-SSID4 are the Guest WiFi SSIDs.  |
|   | If the <b>802.11 Mode</b> in <b>Network Setting &gt; Wireless &gt; Others</b> is set to include 802.11n or 802.11ac, WMM cannot be disabled.   |
| WMM<br>Automatic<br>Power Save<br>Delivery (APSD) | Select this option to extend the battery life of your mobile devices (especially useful for small devices that are running multimedia applications). The Zyxel Device goes to sleep mode to save power when it is not transmitting data. The AP buffers the packets sent to the Zyxel Device until the Zyxel Device "wakes up." The Zyxel Device wakes up periodically to check for incoming data.<br>Note: This works only if the WiFi device to which the Zyxel Device is connected also |
|   | supports this feature.   |
| Cancel  | Click Cancel to restore your previously saved settings.  |
| Apply   | Click Apply to save your changes.  |

Table 40 Network Setting > Wireless > WMM

# 8.7 Others Screen

Use this screen to configure advanced WiFi settings, such as additional security settings, power saving, and data transmission settings. Click **Network Setting** > **Wireless** > **Others**. The screen appears as shown.

See Section 8.11.2 on page 139 for detailed definitions of the terms listed here.

| Preamble                    | Long                 |       |    |
| Protected Management Frames | Capable              | •     |    |
|                             | Cancel               | Apply |    |

Figure 76 Network Setting > Wireless > Others

| LABEL                      | DESCRIPTION   |
|----------------------------|---|
| RTS/CTS<br>Threshold       | Data with its frame size larger than this value will perform the RTS (Request To Send)/CTS (Clear To Send) handshake.   |
|                            | Enter a value between 0 and 2347.   |
| Fragmentation<br>Threshold | This is the maximum data fragment size that can be sent. Enter a value between 256 and 2346.  |
| Output Power               | Set the output power of the Zyxel Device. If there is a high density of APs in an area, decrease the output power to reduce interference with other APs. Select one of the following: 20%, 40%, 60%, 80% or 100%.   |
| Beacon Interval            | When a wirelessly networked device sends a beacon, it includes with it a beacon interval. This specifies the time period before the device sends the beacon again.  |
|                            | The interval tells receiving devices on the network how long they can wait in low power mode before waking up to handle the beacon. This value can be set from 50 ms to 1000 ms. A high value helps save current consumption of the access point.                                     |
| DTIM Interval              | Delivery Traffic Indication Message (DTIM) is the time period after which broadcast and multicast packets are transmitted to mobile clients in the Power Saving mode. A high DTIM value can cause clients to lose connectivity with the network. This value can be set from 1 to 255. |
| 802.11 Mode                | For 2.4 GHz frequency WiFi devices:   |
|                            | • Select <b>802.11b Only</b> to allow only IEEE 802.11b compliant WiFi devices to associate with the Zyxel Device.  |
|                            | Select 802.11g Only to allow only IEEE 802.11g compliant WiFi devices to associate with the Zyxel Device.   |
|                            | <ul> <li>Select 802.11n Only to allow only IEEE 802.11n compliant WiFi devices to associate with the<br/>Zyxel Device.</li> </ul>   |
|                            | <ul> <li>Select 802.11b/g Mixed to allow either IEEE 802.11b or IEEE 802.11g compliant WiFi devices<br/>to associate with the Zyxel Device. The transmission rate of your Zyxel Device might be<br/>reduced.</li> </ul>   |
|                            | <ul> <li>Select 802.11b/g/n Mixed to allow IEEE 802.11b, IEEE 802.11g or IEEE 802.11n compliant WiFi devices to associate with the Zyxel Device. The transmission rate of your Zyxel Device might be reduced.</li> </ul>  |
|                            | For 5 GHz frequency WiFi devices:   |
|                            | Select 802.11a Only to allow only IEEE 802.11a compliant WiFi devices to associate with the Zyxel Device.   |
|                            | Select 802.11n Only to allow only IEEE 802.11n compliant WiFi devices to associate with the Zyxel Device.   |
|                            | Select 802.11ac Only to allow only IEEE 802.11ac compliant WiFi devices to associate with the Zyxel Device.   |
|                            | <ul> <li>Select 802.11a/n Mixed to allow either IEEE 802.11a or IEEE 802.11n compliant WiFi devices<br/>to associate with the Zyxel Device. The transmission rate of your Zyxel Device might be<br/>reduced.</li> </ul>   |
|                            | <ul> <li>Select 802.11n/ac Mixed to allow either IEEE 802.11n or IEEE 802.11ac compliant WiFi devices to associate with the Zyxel Device. The transmission rate of your Zyxel Device might be reduced.</li> </ul>   |
|                            | <ul> <li>Select 802.11a/n/ac Mixed to allow IEEE 802.11a, IEEE 802.11n or IEEE 802.11ac compliant<br/>WiFi devices to associate with the Zyxel Device. The transmission rate of your Zyxel Device<br/>might be reduced.</li> </ul>  |
| 802.11 Protection          | Enabling this feature can help prevent collisions in mixed-mode networks (networks with both IEEE 802.11b and IEEE 802.11g traffic).  |
|                            | Select <b>Auto</b> to have the wireless devices transmit data after a RTS/CTS handshake. This helps improve IEEE 802.11g performance.   |
|                            | Select <b>Off</b> to disable 802.11 protection. The transmission rate of your Zyxel Device might be reduced in a mixed-mode network.  |
|                            | This field displays Off and is not configurable when you set 802.11 Mode to 802.11b Only.   |

Table 41 Network Setting > Wireless > Others

# 8.8 WLAN Scheduler

Use the **WLAN Scheduler** screen to create rules to schedule the times to permit Internet traffic from each wireless network interfaces. Select a specific time and day of a week for scheduling. You can also create a rule to automatically switch off all the WLAN together.

Click Network Setting > Wireless > WLAN Scheduler.

| LABEL                    | DESCRIPTION  |  |
|--------------------------|--|--|
| WLAN Scheduler<br>Access | Click this switch to enable the WLAN scheduler function. This serves as the main switch to allow the individual rules to function.   |  |
| Add New Rule             | Click this to configure a new WLAN scheduler rule.   |  |
| #                        | This is the index number of the entry.   |  |
| Active                   | Click the check box to enable individual rules.  |  |
|                          | Note: Make sure to enable the <b>WLAN Scheduler Access</b> switch for the individual rules to work.  |  |
| Rule Name                | This field displays the name of the rule.  |  |
| SSID                     | This is the descriptive name used to identify the wireless network interface that this rule applies to. Will show ALL WLAN if you select All wireless networks in the Add New Rule screen. |  |
| Day                      | This field displays the days of the week that you wish to apply this rule.   |  |
| Time                     | This field displays the time of the day that you wish to apply this rule.  |  |
| Description              | This field shows a description of the rule, usually to help identify it.   |  |
| Modify                   | Click the Edit icon to configure the rule.   |  |
|                          | Click the <b>Delete</b> icon to remove the rule.   |  |

Table 42 Network Setting > Wireless > WLAN Scheduler

Note: If you enable a rule for a specific SSID, you will not be able to connect to other wireless networks.

### 8.8.1 Add or Edit Rules

Click Add New Rule in the WLAN Scheduler screen, or click the Edit icon next to a scheduling rule, and the following screen displays.

Use this screen to create a scheduling rule to permit Internet traffic from each wireless network interface.

|                   | Add New Rule  |
|-------------------|---|
|                   |   |
| Active            |   |
| SSID              | All WiFi networks   |
| Rule Name         |   |
| ■ Note            |   |
| _                 | nterval you want the specified WiFi network will be automatically |
| Day               | Every<br>day Mon Tue Wed Thu Fri Sat Sun                          |
| Time of Day Range | From To (hhimm  |
| All days          |   |
| Description       |   |
|                   |   |
|                   | Cancel OK   |

Figure 78 Network Setting > Wireless > WLAN Scheduler > Add New Rule

The following table describes the labels in this screen.

| Table 12 | Notwork Sotting > | Wireless > | WI AN Schodula > Add Now Pula |
|----------|-------------------|------------|-------------------------------|
| 10016 43 | Network setting / | MILEIE22 ~ | WLAN Schedule > Add New Rule  |

| LABEL             | DESCRIPTION  |
|-------------------|--|
| Active            | Click this switch to enable this WLAN scheduler rule.  |
| SSID              | Select <b>All wireless networks</b> if you want the rule to apply to all wireless network interfaces or select a wireless network interface to apply the rule to.                                    |
| Rule Name         | Enter a descriptive name for the rule.   |
| Day               | Select the days of the week that you wish to apply this rule.  |
| Time of Day Range | Specify the time of the day that you wish to apply to this rule (format <b>hh:mm</b> ).<br>Note: Click the check box for <b>All days</b> if you wish to apply the rule for the whole day (24 hours). |
| Description       | Enter a description of the rule, usually to help identify it (its purpose).  |
| ОК                | Click <b>OK</b> to save the changes back to the Zyxel Device.  |
| Cancel            | Click Cancel to close the window with changes unsaved.   |

# 8.9 Channel Status

Use this screen to scan for WiFi channel noise and view the results. Click **Scan** to start, and then view the results in the **Channel Scan Result** section. The value on each channel number indicates the number of Access Points (AP) using that channel. The Auto-channel-selection algorithm does not always directly follow the AP count; other factors about the channels are also considered. Click **Network Setting** > **Wireless** > **Channel Status**. The screen appears as shown.

Note: If the current channel is a DFS channel, the warning 'Channel scan process is denied because current channel is a DFS channel (Channel: 52 – 140). If you want to run channel scan, please select a non-DFS channel and try again.' appears.

Note: The AP count may not be a real-time value.

| Table 44 Network Setting > Wireless > Channel Status |

| ) WiFi will select the back-ho                        | ul band automatically.   |
| PI FasyMesh requires 2.4G &                           | 5G to be enabled at the same time.   |

The following table describes the labels in this screen.

| LABEL                  | DESCRIPTION   |  |
|------------------------|---|--|
| EasyMesh<br>Controller | Slide the switch to the right ( ) to enable <b>EasyMesh Controller</b> .  |  |
| On-Boarding            | To enable WPS, click the <b>Trigger</b> button until the WPS LED blink green. Press the WPS button o<br>the client device within 150 seconds. |  |
| ОК                     | Click <b>OK</b> to save the changes back to the Zyxel Device.   |  |
| Cancel                 | Click Cancel to close the window with changes unsaved.  |  |

#### Table 45 Network Setting > Wireless > EasyMesh

# 8.11 Technical Reference

This section discusses WiFi in depth.

#### 8.11.1 WiFi Network Overview

WiFi networks consist of WiFi clients, access points and bridges.

- A WiFi client is a radio connected to a user's computer.
- An access point is a radio with a wired connection to a network, which can connect with numerous WiFi clients and let them access the network.
- A bridge is a radio that relays communications between access points and WiFi clients, extending a network's range.

Normally, a WiFi network operates in an "infrastructure" type of network. An "infrastructure" type of network has one or more access points and one or more WiFi clients. The WiFi clients connect to the access points.

The following figure provides an example of a WiFi network.

The WiFi network is the part in the blue circle. In this WiFi network, devices **A** and **B** use the access point (**AP**) to interact with the other devices (such as the printer) or with the Internet. Your Zyxel Device is the AP.

Every WiFi network must follow these basic guidelines.

• Every WiFi device in the same WiFi network must use the same SSID.

The SSID is the name of the WiFi network. It stands for Service Set IDentifier.

• If two WiFi networks overlap, they should use a different channel.

Like radio stations or television channels, each WiFi network uses a specific channel, or frequency, to send and receive information.

• Every WiFi device in the same WiFi network must use security compatible with the AP.

Security stops unauthorized devices from using the WiFi network. It can also protect the information that is sent in the WiFi network.

### 8.11.2 Additional WiFi Terms

The following table describes some WiFi network terms and acronyms used in the Zyxel Device's Web Configurator.

| TERM                       | DESCRIPTION   |  |
|----------------------------|---|--|
| RTS/CTS Threshold          | In a WiFi network which covers a large area, WiFi devices are sometimes not aware of each other's presence. This may cause them to send information to the AP at the same time and result in information colliding and not getting through. |  |
|                            | By setting this value lower than the default value, the WiFi devices must sometimes get permission to send information to the Zyxel Device. The lower the value, the more often the devices must get permission.                            |  |
|                            | If this value is greater than the fragmentation threshold value (see below), then WiFi devices never have to get permission to send information to the Zyxel Device.  |  |
| Preamble                   | A preamble affects the timing in your WiFi network. There are two preamble modes: long and short. If a WiFi device uses a different preamble mode than the Zyxel Device does, it cannot communicate with the Zyxel Device.                  |  |
| Authentication             | The process of verifying whether a WiFi device is allowed to use the WiFi network.  |  |
| Fragmentation<br>Threshold | A small fragmentation threshold is recommended for busy networks, while a larger threshold provides faster performance if the network is not very busy.   |  |

Table 46 Additional WiFi Terms

### 8.11.3 WiFi Security Overview

By their nature, radio communications are simple to intercept. For WiFi data networks, this means that anyone within range of a WiFi network without security can not only read the data passing over the airwaves, but also join the network. Once an unauthorized person has access to the network, he or she can steal information or introduce malware (malicious software) intended to compromise the network. For these reasons, a variety of security systems have been developed to ensure that only authorized people can use a WiFi data network, or understand the data carried on it.

These security standards do two things. First, they authenticate. This means that only people presenting the right credentials (often a username and password, or a "key" phrase) can access the network. Second, they encrypt. This means that the information sent over the air is encoded. Only people with the code key can understand the information, and only people who have been authenticated are given the code key.

These security standards vary in effectiveness. Some can be broken, such as the old Wired Equivalent Protocol (WEP). Using WEP is better than using no security at all, but it will not keep a determined attacker out. Other security standards are secure in themselves but can be broken if a user does not use them properly. For example, the WPA-PSK security standard is very secure if you use a long key which is difficult for an attacker's software to guess – for example, a twenty-letter long string of apparently random numbers and letters – but it is not very secure if you use a short key which is very easy to guess – for example, a three-letter word from the dictionary.

Because of the damage that can be done by a malicious attacker, it is not just people who have sensitive information on their network who should use security. Everybody who uses any WiFi network should ensure that effective security is in place.

A good way to come up with effective security keys, passwords and so on is to use obscure information that you personally will easily remember, and to enter it in a way that appears random and does not include real words. For example, if your mother owns a 1970 Dodge Challenger and her favorite movie is

Vanishing Point (which you know was made in 1971) you could use "70dodchal71vanpoi" as your security key.

The following sections introduce different types of WiFi security you can set up in the WiFi network.

#### 8.11.3.1 SSID

Normally, the Zyxel Device acts like a beacon and regularly broadcasts the SSID in the area. You can hide the SSID instead, in which case the Zyxel Device does not broadcast the SSID. In addition, you should change the default SSID to something that is difficult to guess.

This type of security is fairly weak, however, because there are ways for unauthorized WiFi devices to get the SSID. In addition, unauthorized WiFi devices can still see the information that is sent in the WiFi network.

#### 8.11.3.2 MAC Address Filter

Every device that can use a WiFi network has a unique identification number, called a MAC address.<sup>1</sup> A MAC address is usually written using twelve hexadecimal characters<sup>2</sup>; for example, 00A0C5000002 or 00:A0:C5:00:00:02. To get the MAC address for each WiFi device in the WiFi network, see the WiFi device's User's Guide or other documentation.

You can use the MAC address filter to tell the Zyxel Device which devices are allowed or not allowed to use the WiFi network. If a WiFi device is allowed to use the WiFi network, it still has to have the correct information (SSID, channel, and security). If a WiFi device is not allowed to use the WiFi network, it does not matter if it has the correct information.

This type of security does not protect the information that is sent in the WiFi network. Furthermore, there are ways for unauthorized WiFi devices to get the MAC address of an authorized WiFi device. Then, they can use that MAC address to use the WiFi network.

#### 8.11.3.3 Encryption

WiFi networks can use encryption to protect the information that is sent in the WiFi network. Encryption is like a secret code. If you do not know the secret code, you cannot understand the message.

The types of encryption you can choose depend on the type of authentication. (See Section 8.11.3.3 on page 140 for information about this.)

|           | NO AUTHENTICATION | RADIUS SERVER                        |
|-----------|-------------------|--------------------------------------|
| Weakest   | No Security       | WPA                                  |
| <b></b>   | WPA-PSK           |                                      |
| Ļ         | WPA2              | WPA2                                 |
| Strongest | WPA3-SAE          | WPA3 (server certificate validation) |

 Table 47
 Types of Encryption for Each Type of Authentication

<sup>1.</sup> Some wireless devices, such as scanners, can detect WiFi networks but cannot use WiFi networks. These kinds of wireless devices might not have MAC addresses.

<sup>2.</sup> Hexadecimal characters are 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, and F.

For example, if the WiFi network has a RADIUS server, you can choose WPA, WPA2, or WPA3. If users do not log in to the WiFi network, you can choose no encryption, WPA2-PSK, or WPA3-SAE.

Note: It is recommended that WiFi networks use **WPA3-SAE**, **WPA2-PSK**, or stronger encryption. The other types of encryption are better than none at all, but it is still possible for unauthorized WiFi devices to figure out the original information pretty quickly.

Many types of encryption use a key to protect the information in the WiFi network. The longer the key, the stronger the encryption. Every device in the WiFi network must have the same key.

### 8.11.4 Signal Problems

Because WiFi networks are radio networks, their signals are subject to limitations of distance, interference and absorption.

Problems with distance occur when the two radios are too far apart. Problems with interference occur when other radio waves interrupt the data signal. Interference may come from other radio transmissions, such as military or air traffic control communications, or from machines that are coincidental emitters such as electric motors or microwaves. Problems with absorption occur when physical objects (such as thick walls) are between the two radios, muffling the signal.

### 8.11.5 BSS

A Basic Service Set (BSS) exists when all communications between wireless stations go through one access point (AP).

Intra-BSS traffic is traffic between wireless stations in the BSS. When Intra-BSS traffic blocking is disabled, wireless station A and B can access the wired network and communicate with each other. When Intra-BSS traffic blocking is enabled, wireless station A and B can still access the wired network but cannot communicate with each other.

#### 8.11.6 MBSSID

Traditionally, you need to use different APs to configure different Basic Service Sets (BSSs). As well as the cost of buying extra APs, there is also the possibility of channel interference. The Zyxel Device's MBSSID (Multiple Basic Service Set IDentifier) function allows you to use one access point to provide several BSSs simultaneously. You can then assign varying QoS priorities and/or security modes to different SSIDs.

Wireless devices can use different BSSIDs to associate with the same AP.

#### 8.11.6.1 Notes on Multiple BSSs

- A maximum of eight BSSs are allowed on one AP simultaneously.
- You must use different keys for different BSSs. If two wireless devices have different BSSIDs (they are in different BSSs), but have the same keys, they may hear each other's communications (but not communicate with each other).
- MBSSID should not replace but rather be used in conjunction with 802.1x security.

### 8.11.7 Preamble Type

Preamble is used to signal that data is coming to the receiver. Short and long refer to the length of the synchronization field in a packet.

Short preamble increases performance as less time sending preamble means more time for sending data. All IEEE 802.11 compliant WiFi adapters support long preamble, but not all support short preamble.

Use long preamble if you are unsure what preamble mode other WiFi devices on the network support, and to provide more reliable communications in busy WiFi networks.

Use short preamble if you are sure all WiFi devices on the network support it, and to provide more efficient communications.

Use the dynamic setting to automatically use short preamble when all WiFi devices on the network support it, otherwise the Zyxel Device uses long preamble.

Note: The WiFi devices MUST use the same preamble mode in order to communicate.

### 8.11.8 WiFi Protected Setup (WPS)

Your Zyxel Device supports WiFi Protected Setup (WPS), which is an easy way to set up a secure WiFi network. WPS is an industry standard specification, defined by the WiFi Alliance.

WPS allows you to quickly set up a WiFi network with strong security, without having to configure security settings manually. Each WPS connection works between two devices. Both devices must support WPS (check each device's documentation to make sure).

Depending on the devices you have, you can either press a button (on the device itself, or in its configuration utility) or enter a PIN (a unique Personal Identification Number that allows one device to authenticate the other) in each of the two devices. When WPS is activated on a device, it has 2 minutes to find another device that also has WPS activated. Then, the two devices connect and set up a secure network by themselves.

#### 8.11.8.1 Push Button Configuration

WPS Push Button Configuration (PBC) is initiated by pressing a button on each WPS-enabled device, and allowing them to connect automatically. You do not need to enter any information.

Not every WPS-enabled device has a physical WPS button. Some may have a WPS PBC button in their configuration utilities instead of or in addition to the physical button.

Take the following steps to set up WPS using the button.

- 1 Ensure that the two devices you want to set up are within WiFi range of one another.
- 2 Look for a WPS button on each device. If the device does not have one, log into its configuration utility and locate the button (see the device's User's Guide for how to do this – for the Zyxel Device, see Section 8.5 on page 128).
- 3 Press the button on one of the devices (it doesn't matter which). For the Zyxel Device you must press the WiFi button for more than 5 seconds.
- 4 Within 2 minutes, press the button on the other device. The registrar sends the network name (SSID) and security key through a secure connection to the enrollee.

If you need to make sure that WPS worked, check the list of associated WiFi clients in the AP's configuration utility. If you see the WiFi client in the list, WPS was successful.

#### 8.11.8.2 PIN Configuration

Each WPS-enabled device has its own PIN (Personal Identification Number). This may either be static (it cannot be changed) or dynamic (in some devices you can generate a new PIN by clicking on a button in the configuration interface).

Use the PIN method instead of the push-button configuration (PBC) method if you want to ensure that the connection is established between the devices you specify, not just the first two devices to activate WPS in range of each other. However, you need to log into the configuration interfaces of both devices to use the PIN method.

When you use the PIN method, you must enter the PIN from one device (usually the WiFi client) into the second device (usually the Access Point or wireless router). Then, when WPS is activated on the first device, it presents its PIN to the second device. If the PIN matches, one device sends the network and security information to the other, allowing it to join the network.

Take the following steps to set up a WPS connection between an access point or wireless router (referred to here as the AP) and a client device using the PIN method.

- 1 Ensure WPS is enabled on both devices.
- 2 Access the WPS section of the AP's configuration interface. See the device's User's Guide on how to do this.
- 3 Look for the client's WPS PIN; it will be displayed either on the device, or in the WPS section of the client's configuration interface (see the device's User's Guide on how to find the WPS PIN for the Zyxel Device, see Section 8.5 on page 128).
- 4 Enter the client's PIN in the AP's configuration interface.
- 5 If the client device's configuration interface has an area for entering another device's PIN, you can either enter the client's PIN in the AP, or enter the AP's PIN in the client it does not matter which.
- 6 Start WPS on both devices within two minutes.
- 7 Use the configuration utility to activate WPS, not the push-button on the device itself.
- 8 On a computer connected to the WiFi client, try to connect to the Internet. If you can connect, WPS was successful.

If you cannot connect, check the list of associated WiFi clients in the AP's configuration utility. If you see the WiFi client in the list, WPS was successful.

The following figure shows a WPS-enabled WiFi client (installed in a notebook computer) connecting to the WPS-enabled AP through the PIN method.

#### 8.11.8.3 How WPS Works

When two WPS-enabled devices connect, each device must assume a specific role. One device acts as the registrar (the device that supplies network and security settings) and the other device acts as the enrollee (the device that receives network and security settings. The registrar creates a secure EAP (Extensible Authentication Protocol) tunnel and sends the network name (SSID) and the WPA-PSK or WPA2-PSK pre-shared key to the enrollee. Whether WPA-PSK or WPA2-PSK is used depends on the standards supported by the devices. If the registrar is already part of a network, it sends the existing information. If not, it generates the SSID and WPA2-PSK randomly.

The following figure shows a WPS-enabled client (installed in a notebook computer) connecting to a WPS-enabled access point.

The roles of registrar and enrollee last only as long as the WPS setup process is active (2 minutes). The next time you use WPS, a different device can be the registrar if necessary.

The WPS connection process is like a handshake; only two devices participate in each WPS transaction. If you want to add more devices you should repeat the process with one of the existing networked devices and the new device.

Note that the access point (AP) is not always the registrar, and the WiFi client is not always the enrollee. All WPS-certified APs can be a registrar, and so can some WPS-enabled WiFi clients.

By default, a WPS device is 'un-configured'. This means that it is not part of an existing network and can act as either enrollee or registrar (if it supports both functions). If the registrar is un-configured, the security settings it transmits to the enrollee are randomly-generated. Once a WPS-enabled device has connected to another device using WPS, it becomes 'configured'. A configured WiFi client can still act as enrollee or registrar in subsequent WPS connections, but a configured access point can no longer act as enrollee. It will be the registrar in all subsequent WPS connections in which it is involved. If you want a configured AP to act as an enrollee, you must reset it to its factory defaults.

#### 8.11.8.4 Example WPS Network Setup

This section shows how security settings are distributed in a sample WPS setup.

The following figure shows a sample network. In step 1, both **AP1** and **Client 1** are un-configured. When WPS is activated on both, they perform the handshake. In this example, **AP1** is the registrar, and **Client 1** is the enrollee. The registrar randomly generates the security information to set up the network, since it is un-configured and has no existing information.

In step 2, you add another WiFi client to the network. You know that Client 1 supports registrar mode, but it is better to use AP1 for the WPS handshake with the new client since you must connect to the access point anyway in order to use the network. In this case, AP1 must be the registrar, since it is configured (it already has security information for the network). AP1 supplies the existing security information to Client 2.

Figure 86 WPS: Example Network Step 2

#### CLIENT 2

In step 3, you add another access point (AP2) to your network. AP2 is out of range of AP1, so you cannot use AP1 for the WPS handshake with the new access point. However, you know that Client 2 supports the registrar function, so you use it to perform the WPS handshake instead.

#### Figure 87 WPS: Example Network Step 3

#### 8.11.8.5 Limitations of WPS

WPS has some limitations of which you should be aware.

• When you use WPS, it works between two devices only. You cannot enroll multiple devices simultaneously, you must enroll one after the other.

For instance, if you have two enrollees and one registrar you must set up the first enrollee (by pressing the WPS button on the registrar and the first enrollee, for example), then check that it was successfully enrolled, then set up the second device in the same way.

• WPS works only with other WPS-enabled devices. However, you can still add non-WPS devices to a network you already set up using WPS.

WPS works by automatically issuing a randomly-generated WPA-PSK or WPA2-PSK pre-shared key from the registrar device to the enrollee devices. Whether the network uses WPA-PSK or WPA2-PSK depends on the device. You can check the configuration interface of the registrar device to discover the key the network is using (if the device supports this feature). Then, you can enter the key into the non-WPS device and join the network as normal (the non-WPS device must also support WPA-PSK or WPA2-PSK).

• When you use the PBC method, there is a short period (from the moment you press the button on one device to the moment you press the button on the other device) when any WPS-enabled device could join the network. This is because the registrar has no way of identifying the 'correct' enrollee, and cannot differentiate between your enrollee and a rogue device. This is a possible way for a hacker to gain access to a network.

You can easily check to see if this has happened. WPS only works simultaneously between two devices, so if another device has enrolled your device will be unable to enroll, and will not have access to the network. If this happens, open the access point's configuration interface and look at the list of associated clients (usually displayed by MAC address). It does not matter if the access point is the WPS registrar, the enrollee, or was not involved in the WPS handshake; a rogue device must still associate with the access point to gain access to the network. Check the MAC addresses of your WiFi clients (usually printed on a label on the bottom of the device). If there is an unknown MAC address you can remove it or reset the AP.

# CHAPTER 9 Home Networking

# 9.1 Home Networking Overview

A Local Area Network (LAN) is a shared communication system to which many computers are attached. A LAN is usually located in one immediate area such as a building or floor of a building.

The LAN screens can help you configure a LAN DHCP server and manage IP addresses.

Figure 88 Home Networking Example

## 9.1.1 What You Can Do in this Chapter

- Use the LAN Setup screen to set the LAN IP address, subnet mask, and DHCP settings (Section 9.2 on page 151).
- Use the Static DHCP screen to assign IP addresses on the LAN to specific individual computers based on their MAC addresses (Section 9.3 on page 155).
- Use the UPnP screen to enable UPnP (Section 9.4 on page 157).

## 9.1.2 What You Need To Know

The following terms and concepts may help as you read this chapter.

#### 9.1.2.1 About LAN

#### **IP Address**

Similar to the way houses on a street share a common street name, so too do computers on a LAN share one common network number. This is known as an Internet Protocol address.

#### Subnet Mask

The subnet mask specifies the network number portion of an IP address. Your Zyxel Device will compute the subnet mask automatically based on the IP address that you entered. You do not need to change the subnet mask computed by the Zyxel Device unless you are instructed to do otherwise.

149

### DHCP

DHCP (Dynamic Host Configuration Protocol) allows clients to obtain TCP/IP configuration at start-up from a server. This Zyxel Device has a built-in DHCP server capability that assigns IP addresses and DNS servers to systems that support DHCP client capability.

#### DNS

DNS (Domain Name System) maps a domain name to its corresponding IP address and vice versa. The DNS server is extremely important because without it, you must know the IP address of a computer before you can access it. The DNS server addresses you enter when you set up DHCP are passed to the client machines along with the assigned IP address and subnet mask.

#### 9.1.2.2 About UPnP

#### How do I know if I am using UPnP?

UPnP hardware is identified as an icon in the Network Connections folder (Windows 7). Each UPnP compatible device installed on your network will appear as a separate icon. Selecting the icon of a UPnP device will allow you to access the information and properties of that device.

#### NAT Traversal

UPnP NAT traversal automates the process of allowing an application to operate through NAT. UPnP network devices can automatically configure network addressing, announce their presence in the network to other UPnP devices and enable exchange of simple product and service descriptions. NAT traversal allows the following:

- Dynamic port mapping
- Learning public IP addresses
- Assigning lease times to mappings

Windows Messenger is an example of an application that supports NAT traversal and UPnP.

#### Cautions with UPnP

The automated nature of NAT traversal applications in establishing their own services and opening firewall ports may present network security issues. Network information and configuration may also be obtained and modified by users in some network environments.

When a UPnP device joins a network, it announces its presence with a multicast message. For security reasons, the Zyxel Device allows multicast messages on the LAN only.

All UPnP-enabled devices may communicate freely with each other without additional configuration. Disable UPnP if this is not your intention.

### **UPnP and Zyxel**

Zyxel has achieved UPnP certification from the Universal Plug and Play Forum UPnP™ Implementers Corp. (UIC).

See Section 9.6 on page 161 for examples on installing and using UPnP.

# 9.2 LAN Setup

A LAN IP address is the IP address of a networking device in the LAN. You can use the Zyxel Device's LAN IP address to access its Web Configurator from the LAN. The DHCP server settings define the rules on assigning IP addresses to LAN clients on your network.

Use this screen to set the Local Area Network IP address and subnet mask of your Zyxel Device. Configure DHCP settings to have the Zyxel Device or a DHCP server assign IP addresses to devices. Click Network Setting > Home Networking to open the LAN Setup screen.

Follow these steps to configure your LAN settings.

- 1 Enter an IP address into the IP Address field. The IP address must be in dotted decimal notation. This will become the IP address of your Zyxel Device.
- 2 Enter the IP subnet mask into the IP Subnet Mask field. Unless instructed otherwise it is best to leave this alone, the configurator will automatically compute a subnet mask based upon the IP address you entered.
- 3 Click Apply to save your settings.

| Table 48 | Network Setting > Home | Networking > LAN Setup |

| LABEL                             | DESCRIPTION   |
|-----------------------------------|---|
| Interface Group                   |   |
| Group Name                        | Select the interface group that you want to configure its LAN settings.   |
| LAN IP Setup                      |   |
| IP Address                        | Enter the LAN IP address you want to assign to your Zyxel Device in dotted decimal notation, for example, 192.168.1.1 (factory default).  |
| Subnet Mask                       | Enter the subnet mask of your network in dotted decimal notation, for example 255.255.255.0 (factory default). Your Zyxel Device automatically computes the subnet mask based on the IP address you enter, so do not change this field unless you are instructed to do so.  |
| DHCP Server State                 | •   |
| DHCP                              | Select <b>Enable</b> to have your Zyxel Device assign IP addresses, an IP default gateway and DNS servers to LAN computers and other devices that are DHCP clients.   |
|                                   | If you select <b>Disable</b> , you need to manually configure the IP addresses of the computers and other devices on your LAN.  |
|                                   | If you select <b>DHCP Relay</b> , the Zyxel Device acts as a surrogate DHCP server and relays DHCP requests and responses between the remote server and the clients.  |
| IP Addressing Values              | •   |
| The IP Addressing Va              | lues fields appear only when you select Enable in the DHCP field.   |
| Beginning IP<br>Address           | This field specifies the first of the contiguous addresses in the IP address pool.  |
| Ending IP Address                 | This field specifies the last of the contiguous addresses in the IP address pool.   |
| Auto reserve IP for the same host | Enable this if you want to reserve the IP address for the same host.  |
| DHCP Server Lease Ti              | me  |
| they log in. DHCP cer             | ne DHCP-assigned addresses is used. DHCP automatically assigns IP addresses to clients when<br>ntralizes IP address management on central computers that run the DHCP server program.<br>es, for a period of time, which means that past addresses are "recycled" and made available<br>nt to other systems.  |
| This field is only availe         | able when you select <b>Enable</b> in the <b>DHCP</b> field.  |
| Days/Hours/Minutes                | DHCP server leases an address to a new client device for a period of time, called the DHCP lease time. When the lease expires, the DHCP server might assign the IP address to a different client device.  |
| DNS Values                        |   |
| This field appears only           | y when you select <b>Enable</b> in the <b>DHCP</b> field.   |
| DNS                               | The Zyxel Device supports DNS proxy by default. The Zyxel Device sends out its own LAN IP address to the DHCP clients as the first DNS server address. DHCP clients use this first DNS server to send domain-name queries to the Zyxel Device. The Zyxel Device sends a response directly if it has a record of the domain-name to IP address mapping. If it does not, the Zyxel Device queries an outside DNS server and relays the response to the DHCP client. |
|                                   | Select <b>DNS Proxy</b> to have the DHCP clients use the Zyxel Device's own LAN IP address. The Zyxel Device works as a DNS relay.  |
|                                   | Select <b>Static</b> if you have the IP address of a DNS server. Enter the DNS server's IP address in the field to the right.   |
|                                   | Select <b>From ISP</b> if your ISP dynamically assigns DNS server information (and the Zyxel Device's WAN IP address).  |

| LABEL                         | DESCRIPTION  |  |  |  |  |
|-------------------------------|--|--|--|--|--|
| LAN IPv6 Mode Setup           | )  |  |  |  |  |
| IPv6 Active                   | Use this to enable or disable IPv6 on the Zyxel Device.  |  |  |  |  |
|                               | When IPv6 is used, the following fields need to be set.  |  |  |  |  |
| Link Local Address<br>Type    | A link-local address uniquely identifies a device on the local network (the LAN). It is similar to<br>a "private IP address" in IPv6. You can have the same link-local address on multiple<br>interfaces on a device. A link-local unicast address has a predefined prefix of fe80::/10. The<br>link-local unicast address format is as follows. Select EUI64 to allow the Zyxel Device to<br>generate an interface ID for the LAN interface's link-local address using the EUI-64 format.<br>Otherwise, enter an interface ID for the LAN interface's link-local address if you select<br>Manual. |  |  |  |  |
|                               | 1111 1110 10 0 Interface ID  |  |  |  |  |
|                               | 10 bits 54 bits 64 bits  |  |  |  |  |
| EUI64                         | Select this to have the Zyxel Device generate an interface ID for the LAN interface's link-<br>local address using the EUI-64 format.  |  |  |  |  |
| Manual                        | Select this to manually enter an interface ID for the LAN interface's link-local address.  |  |  |  |  |
| LAN Global<br>Identifier Type | Select <b>EUI64</b> to have the Zyxel Device generate an interface ID using the EUI-64 format for its global address. Select <b>Manual</b> to manually enter an interface ID for the LAN interface's global IPv6 address.  |  |  |  |  |
| EUI64                         | Select this to have the Zyxel Device generate an interface ID using the EUI-64 format for its global address.  |  |  |  |  |
| Manual                        | Select this to manually enter an interface ID for the LAN interface's global IPv6 address.   |  |  |  |  |
| LAN IPv6 Prefix<br>Setup      | Select <b>Delegate prefix from WAN</b> to automatically obtain an IPv6 network prefix from the service provider or an uplink router. Select <b>Static</b> to configure a fixed IPv6 address for the Zyxel Device's LAN IPv6 address.   |  |  |  |  |
| Delegate prefix<br>from WAN   | Select this option to automatically obtain an IPv6 network prefix from the service provider or an uplink router.   |  |  |  |  |
| Static                        | Select this option to configure a fixed IPv6 address for the Zyxel Device's LAN IPv6 address.  |  |  |  |  |
| LAN IPv6 Address              | Select how you want to obtain an IPv6 address:   |  |  |  |  |
| Assign Setup                  | <b>Stateless:</b> The Zyxel Device uses IPv6 stateless auto-configuration. RADVD (Router Advertisement Daemon) is enabled to have the Zyxel Device send IPv6 prefix information in router advertisements periodically and in response to router solicitations. DHCPv6 server is disabled.  |  |  |  |  |
|                               | <b>Stateful:</b> The Zyxel Device uses IPv6 stateful auto-configuration. The DHCPv6 server is enabled to have the Zyxel Device act as a DHCPv6 server and pass IPv6 addresses to DHCPv6 clients.   |  |  |  |  |
| LAN IPv6 DNS Assign<br>Setup  | Select how the Zyxel Device provide DNS server and domain name information to the clients:   |  |  |  |  |
|                               | From RA & DHCPv6 Server: The Zyxel Device provides DNS information through both router advertisements and DHCPv6.  |  |  |  |  |
|                               | From DHCPv6 Server: The Zyxel Device provides DNS information through DHCPv6.  |  |  |  |  |
|                               | From Router Advertisement: The Zyxel Device provides DNS information through router advertisements.  |  |  |  |  |
| DHCPv6 Configuratio           | n  |  |  |  |  |
| DHCPv6 Active                 | This shows the status of the DHCPv6. <b>DHCP Server</b> displays if you configured the Zyxel Device to act as a DHCPv6 server which assigns IPv6 addresses and/or DNS information to clients.  |  |  |  |  |

| RADVD Active          | This shows whether RADVD is enabled or not.   |
| IPv6 DNS Values       |   |
| IPv6 DNS Server 1 – 3 | Specify the IP addresses up to three DNS servers for the DHCP clients to use. Use one of the following ways to specify these IP addresses.  |
|                       | <b>User Defined</b> – Select this if you have the IPv6 address of a DNS server. Enter the DNS server IPv6 addresses the Zyxel Device passes to the DHCP clients.                              |
|                       | From ISP – Select this if your ISP dynamically assigns IPv6 DNS server information.   |
|                       | <b>Proxy</b> – Select this if the DHCP clients use the IP address of this interface and the Zyxel Device works as a DNS relay.  |
|                       | Otherwise, select None if you do not want to configure IPv6 DNS servers.  |
| DNS Query Scenario    | Select how the Zyxel Device handles clients' DNS information requests.  |
|                       | <b>IPv4/IPv6 DNS Server</b> : The Zyxel Device forwards the requests to both the IPv4 and IPv6 DNS servers and sends clients the first DNS information it receives.                           |
|                       | <b>IPv6 DNS Server Only</b> : The Zyxel Device forwards the requests to the IPv6 DNS server and sends clients the DNS information it receives.  |
|                       | <b>IPv4 DNS Server Only</b> : The Zyxel Device forwards the requests to the IPv4 DNS server and sends clients the DNS information it receives.  |
|                       | <b>IPv6 DNS Server First</b> : The Zyxel Device forwards the requests to the IPv6 DNS server first and then the IPv4 DNS server. Then it sends clients the first DNS information it receives. |
|                       | <b>IPv4 DNS Server First</b> : The Zyxel Device forwards the requests to the IPv4 DNS server first and then the IPv6 DNS server. Then it sends clients the first DNS information it receives. |
| Apply                 | Click Apply to save your changes.   |
| Cancel                | Click Cancel to restore your previously saved settings.   |

Table 48 Network Setting > Home Networking > LAN Setup (continued)

\_\_\_\_\_

# 9.3 Static DHCP

When any of the LAN clients in your network want an assigned fixed IP address, add a static lease for each LAN client. Knowing the LAN client's MAC addresses is necessary. This table allows you to assign IP addresses on the LAN to individual computers based on their MAC addresses.

Every Ethernet device has a unique MAC (Media Access Control) address. The MAC address is assigned at the factory and consists of six pairs of hexadecimal characters, for example, 00:A0:C5:00:00:02.

## 9.3.1 Before You Begin

Find out the MAC addresses of your network devices if you intend to add them to the Static DHCP screen.

Use this screen to change your Zyxel Device's static DHCP settings. Click **Network Setting** > **Home Networking** > **Static DHCP** to open the following screen.

| Fiaure 90 | Network Setting > Home | e Networking > Static DHC | P |
|-----------|------------------------|---------------------------|---|
|           |                        |                           |   |

| When any of the LAN clients in your network want an assigned fixed IP address, add a static lease for each LAN client. Knowing the LAN client's MAC addresses is necessary. Assign IP addresses on the LAN to specific individual computers based on their MAC addresses. |        |             |            |                           |  |

| Status                       | This field displays whether the client is connected to the Zyxel Device.   |
| MAC Address                  | The MAC (Media Access Control) or Ethernet address on a LAN (Local Area Network) is unique to your computer (six pairs of hexadecimal notation).<br>A network interface card such as an Ethernet adapter has a hardwired address that is |
|                              | assigned at the factory. This address follows an industry standard that ensures no other adapter has a similar address.  |
| IP Address                   | This field displays the IP address relative to the # field listed above.   |
| Modify                       | Click the Edit icon to configure the connection.   |
|                              | Click the <b>Delete</b> icon to remove the connection.   |

Table 49 Network Setting > Home Networking > Static DHCP

If you click **Static DHCP Configuration** in the **Static DHCP** screen, the following screen displays. Using a static DHCP means a LAN client will always have the same IP address assigned to it by the DHCP server. Assign a fixed IP address to a client device by selecting the interface group of this client device and its IP address type and selecting the device/computer from a list or manually entering its MAC address and assigned IP address.

| Group Name         | Select the interface group for which you want to configure the static DHCP settings.  |
| IP Туре            | The IP Type is normally IPv4 (non-configurable).  |
| Select Device Info | Select between <b>Manual Input</b> which allows you to enter the next two fields ( <b>MAC Address</b> and <b>IP Address</b> ); or select an existing LAN device to show its MAC address and IP address. |
| MAC Address        | Enter the MAC address of a computer on your LAN if you select <b>Manual Input</b> in the previous field.  |
| IP Address         | Enter the IP address that you want to assign to the computer on your LAN with the MAC address that you will also specify if you select <b>Manual Input</b> in the previous field.                       |
| ОК                 | Click <b>OK</b> to save your changes.   |
| Cancel             | Click <b>Cancel</b> to exit this screen without saving.   |

 Table 50
 Network Setting > Home Networking > Static DHCP: Static DHCP Configuration

# 9.4 UPnP

Universal Plug and Play (UPnP) is an open networking standard that uses TCP/IP for simple peer-to-peer network connectivity between networking devices or software applications which have UPnP enabled. A UPnP device can dynamically join a network, obtain an IP address, advertise its services, and learn about other devices on the network. A device can also leave a network automatically when it is no longer in use.

See Section 9.6 on page 161 for more information on UPnP.

# Note: To use UPnP NAT-T, enable NAT in the Network Setting > Broadband > Edit or Add New WAN Interface screen.

Use the following screen to configure the UPnP settings on your Zyxel Device. Click **Network Setting** > **Home Networking** > **UPnP** to display the screen shown next.

| conn<br>netw | ectivity between netw<br>ork, obtain an IP addr | InP) is a distributed, open networking<br>vorking devices and software that a<br>ess, convey its capabilities and lear<br>omatically when it is no longer in use | lso have UPnP enabled<br>n about other devices o | . | UPnP         | NAT-T   |  |  |                       |                   |
| Note         |   |  |  |                       |                   |
| JPnP N       | AT-T only works when M                          | VAT is enable  |  |                       |                   |
| #            | Description                                     | Destination IP Address   | External Port                                    | Internal Port         | Protocol          |
|              |   |  |  |                       |                   |
|              |   | Cancel   | Apply  |                       |                   |

| LABEL                     | DESCRIPTION   |
|---------------------------|---|
| UPnP State                | ·   |
| UPnP                      | Select <b>Enable</b> to activate UPnP. Be aware that anyone could use a UPnP application to open the Web Configurator's login screen without entering the Zyxel Device's IP address (although you must still enter the password to access the Web Configurator).  |
| UPnP NAT-T State          | ·   |
| UPnP NAT-T                | Select <b>Enable</b> to activate UPnP with NAT enabled. UPnP NAT traversal automates the process of allowing an application to operate through NAT. UPnP network devices can automatically configure network addressing, announce their presence in the network to other UPnP devices and enable exchange of simple product and service descriptions. |
| #                         | This field displays the index number of the entry.  |
| Description               | This field displays the description of the UPnP NAT-T connection.   |
| Destination IP<br>Address | This field displays the IP address of the other connected UPnP-enabled device.  |
| External Port             | This field displays the external port number that identifies the service.   |
| Internal Port             | This field displays the internal port number that identifies the service.   |
| Protocol                  | This field displays the protocol of the NAT mapping rule. Choices are <b>TCP</b> or <b>UDP</b> .  |
| Apply                     | Click Apply to save your changes.   |
| Cancel                    | Click Cancel to restore your previously saved settings.   |

Table 51 Network Settings > Home Networking > UPnP

# 9.5 Technical Reference

This section provides some technical background information about the topics covered in this chapter.

## LANs, WANs and the Zyxel Device

The actual physical connection determines whether the Zyxel Device ports are LAN or WAN ports. There are two separate IP networks, one inside the LAN network and the other outside the WAN network as shown next.

## 9.5.1 DHCP Setup

DHCP (Dynamic Host Configuration Protocol, RFC 2131 and RFC 2132) allows individual clients to obtain TCP/IP configuration at start-up from a server. You can configure the Zyxel Device as a DHCP server or disable it. When configured as a server, the Zyxel Device provides the TCP/IP configuration for the clients. If you turn DHCP service off, you must have another DHCP server on your LAN, or else the computer must be manually configured.

#### **IP Pool Setup**

The Zyxel Device is pre-configured with a pool of IP addresses for the DHCP clients (DHCP Pool). See the product specifications in the appendices. Do not assign static IP addresses from the DHCP pool to your LAN computers.

## 9.5.2 DNS Server Addresses

DNS (Domain Name System) maps a domain name to its corresponding IP address and vice versa. The DNS server is extremely important because without it, you must know the IP address of a computer before you can access it. The DNS server addresses you enter when you set up DHCP are passed to the client machines along with the assigned IP address and subnet mask.

There are two ways that an ISP disseminates the DNS server addresses.

• The ISP tells you the DNS server addresses, usually in the form of an information sheet, when you sign up. If your ISP gives you DNS server addresses, enter them in the **DNS Server** fields in the **DHCP Setup** screen.

 Some ISPs choose to disseminate the DNS server addresses using the DNS server extensions of IPCP (IP Control Protocol) after the connection is up. If your ISP did not give you explicit DNS servers, chances are the DNS servers are conveyed through IPCP negotiation. The Zyxel Device supports the IPCP DNS server extensions through the DNS proxy feature.

Please note that DNS proxy works only when the ISP uses the IPCP DNS server extensions. It does not mean you can leave the DNS servers out of the DHCP setup under all circumstances. If your ISP gives you explicit DNS servers, make sure that you enter their IP addresses in the **DHCP Setup** screen.

## 9.5.3 LAN TCP/IP

The Zyxel Device has built-in DHCP server capability that assigns IP addresses and DNS servers to systems that support DHCP client capability.

#### **IP Address and Subnet Mask**

Similar to the way houses on a street share a common street name, so too do computers on a LAN share one common network number.

Where you obtain your network number depends on your particular situation. If the ISP or your network administrator assigns you a block of registered IP addresses, follow their instructions in selecting the IP addresses and the subnet mask.

If the ISP did not explicitly give you an IP network number, then most likely you have a single user account and the ISP will assign you a dynamic IP address when the connection is established. If this is the case, it is recommended that you select a network number from 192.168.0.0 to 192.168.255.0 and you must enable the Network Address Translation (NAT) feature of the Zyxel Device. The Internet Assigned Number Authority (IANA) reserved this block of addresses specifically for private use; please do not use any other number unless you are told otherwise. Let's say you select 192.168.1.0 as the network number; which covers 254 individual addresses, from 192.168.1.1 to 192.168.1.254 (zero and 255 are reserved). In other words, the first three numbers specify the network number while the last number identifies an individual computer on that network.

Once you have decided on the network number, pick an IP address that is easy to remember, for instance, 192.168.1.1, for your Zyxel Device, but make sure that no other device on your network is using that IP address.

The subnet mask specifies the network number portion of an IP address. Your Zyxel Device will compute the subnet mask automatically based on the IP address that you entered. You do not need to change the subnet mask computed by the Zyxel Device unless you are instructed to do otherwise.

#### **Private IP Addresses**

Every machine on the Internet must have a unique address. If your networks are isolated from the Internet, for example, only between your two branch offices, you can assign any IP addresses to the hosts without problems. However, the Internet Assigned Numbers Authority (IANA) has reserved the following three blocks of IP addresses specifically for private networks:

- 10.0.0.0 10.255.255.255
- 172.16.0.0 172.31.255.255
- 192.168.0.0 192.168.255.255

You can obtain your IP address from the IANA, from an ISP or it can be assigned from a private network. If you belong to a small organization and your Internet access is through an ISP, the ISP can provide you with the Internet addresses for your local networks. On the other hand, if you are part of a much larger organization, you should consult your network administrator for the appropriate IP addresses.

Note: Regardless of your particular situation, do not create an arbitrary IP address; always follow the guidelines above. For more information on address assignment, please refer to RFC 1597, "Address Allocation for Private Internets" and RFC 1466, "Guidelines for Management of IP Address Space".

# 9.6 Turn on UPnP in Windows 10 Example

This section shows you how to use the UPnP feature in Windows 10. UPnP server is installed in Windows 10. Activate UPnP on the Zyxel Device by clicking **Network Setting** > **Home Networking** > **UPnP**.

Make sure the computer is connected to the LAN port of the Zyxel Device. Turn on your computer and the Zyxel Device.

1 Click the start icon, **Settings** and then **Network & Internet**.

| Settings |             |   |   |   |          |   |              | _  | × |

## 9.6.1 Auto-discover Your UPnP-enabled Network Device

Before you follow these steps, make sure you already have UPnP activated on the Zyxel Device and in your computer.

Make sure your computer is connected to the LAN port of the Zyxel Device.

- 1 Open File Explorer and click Network.
- 2 Right-click the Zyxel Device icon and select Properties.

# CHAPTER 10 Routing

# 10.1 Routing Overview

The Zyxel Device usually uses the default gateway to route outbound traffic from computers on the LAN to the Internet. To have the Zyxel Device send data to devices not reachable through the default gateway, use static routes.

For example, the next figure shows a computer (A) connected to the Zyxel Device's LAN interface. The Zyxel Device routes most traffic from A to the Internet through the Zyxel Device's default gateway (R1). You create one static route to connect to services offered by your ISP behind router R2. You create another static route to communicate with a separate network behind a router R3 connected to the LAN.

Figure 103 Example of Static Routing Topology

# 10.2 Configure Static Route

Use this screen to view and configure static route rules on the Zyxel Device. A static route is used to save time and bandwidth usage when LAN devices within an Intranet are transferring files or packets, especially when there are more than two Internet connections in your home or office network. Click **Network Setting > Routing** to open the **Static Route** screen.

| LABEL                         | DESCRIPTION  |
|-------------------------------|--|
| Add New Static<br>Route       | Click this to set up a new static route on the Zyxel Device.   |
| #                             | This is the number of an individual static route.  |
| Status                        | This field indicates whether the rule is active (yellow bulb) or not (gray bulb).  |
| Name                          | This is the name of the static route.  |
| Destination IP                | This parameter specifies the IP network address of the final destination. Routing is always based on network number.   |
| Subnet Mask/<br>Prefix Length | This parameter specifies the IP network subnet mask of the final destination.  |
| Gateway                       | This is the IP address of the gateway. The gateway is a router or switch on the same network segment as the device's LAN or WAN port. The gateway helps forward packets to their destinations. |
| Interface                     | This is the WAN interface through which the traffic is routed.   |
| Modify                        | Click the Edit icon to go to the screen where you can set up a static route on the Zyxel Device.   |
|                               | Click the <b>Delete</b> icon to remove a static route from the Zyxel Device.   |

Table 52 Network Setting > Routing > Static Route

## 10.2.1 Add or Edit Static Route

Use this screen to add or edit a static route. Click Add New Static Route in the Static Route screen, the following screen appears. Configure the required information for a static route.

Note: The Gateway IP Address must be within the range of the selected interface in Use Interface.

| Figure | 105 Network Settin | ng > Routing > Static Route > Add New | / Static Route |
|--------|--------------------|---------------------------------------|----------------|

| Destination IP Address        |                  | ÷               |                 | ÷               |     |  |
| Subnet Mask                   |                  |                 | 4.4.6           |                 |     |  |
| Use Gateway IP Address        |                  |                 |                 |                 |     |  |
| Gateway IP Address            |                  |                 | 640             |                 |     |  |
| Use Interface                 | Default          |                 |                 |                 |     |  |
| ∃ Note                        |                  |                 |                 |                 |     |  |
| The Gateway IP Address must t | be within the ro | ange of the sel | ected interface | in Use Interfac | ce. |  |

| LABEL                     | DESCRIPTION  |
|---------------------------|--|
| Active                    | Click this switch to activate static route. Otherwise, click to disable.   |
| Route Name                | Enter a name for your static route. Up to 15 printable ASCII characters are allowed except ["], [<br>`], ['], [<], [>], [^], [\$], [], [&], or [;].  |
| ІР Туре                   | Select between IPv4 or IPv6. Compared to IPv4, IPv6 (Internet Protocol version 6), is designed to enhance IP address size and features. The increase in IPv6 address size to 128 bits (from the 32-bit IPv4 address) allows up to 3.4 x 1038 IP addresses. The Zyxel Device can use IPv4/IPv6 dual stack to connect to IPv4 and IPv6 networks, and supports IPv6 rapid deployment (6RD). |
| Destination IP<br>Address | This parameter specifies the IP network address of the final destination. Routing is always based<br>on network number. If you need to specify a route to a single host, use a subnet mask of<br>255.255.255.255 in the subnet mask field to force the network number to be identical to the host<br>ID.   |
| Subnet Mask               | If you are using IPv4 and need to specify a route to a single host, use a subnet mask of 255.255.255.255 in the subnet mask field to force the network number to be identical to the host ID. Enter the IP subnet mask here.   |
| Use Gateway IP<br>Address | The gateway is a router or switch on the same network segment as the device's LAN or WAN port. The gateway helps forward packets to their destinations.  |
|                           | Click this switch to enable or disable the gateway IP address. When the switch goes to the right, the function is enabled. Otherwise, it is not.   |
| User Interface            | You can decide if you want to forward packets to a gateway IP address ( <b>Default</b> ) or a bound<br>interface ( <b>Cellular WAN</b> ).<br>If you want to configure bound interface, choose an interface through which the traffic is sent.<br>You must have the WAN interfaces already configured in the <b>Broadband</b> screen.   |
| OK                        | Click this to save your changes.   |
| Cancel                    | Click this to exit this screen without saving.   |

#### 10.2.1.1 An Example of Adding a Static Route

In order to extend your Intranet and control traffic flowing directions, you may connect a router to the Zyxel Device's LAN. The router may be used to separate two department networks. This tutorial shows how to configure a static routing rule for two network routings.

In the following figure, router **R** is connected to the Zyxel Device's LAN. **R** connects to two networks, **N1** (192.168.1.x/24) and **N2** (192.168.10.x/24). If you want to send traffic from computer **A** (in **N1** network) to computer **B** (in **N2** network), the traffic is sent to the Zyxel Device's WAN default gateway by default. In this case, **B** will never receive the traffic.

You need to specify a static routing rule on the Zyxel Device to specify **R** as the router in charge of forwarding traffic to **N2**. In this case, the Zyxel Device routes traffic from **A** to **R** and then **R** routes the traffic to **B**.

This tutorial uses the following example IP settings:

| IP ADDRESS    |
|---------------|
| 172.16.1.1    |
| 192.168.1.1   |
| IPv4          |
| VDSL          |
| 192.168.1.34  |
| 192.168.1.253 |
| 192.168.10.2  |
| 192.168.10.33 |
|               |

| Table 54 | IP Settings in this Tutorial |
|----------|------------------------------|
|          |                              |

To configure a static route to route traffic from N1 to N2:

- 1 Log into the Zyxel Device's Web Configurator.
- 2 Click Network Setting > Routing.
- 3 Click Add new Static Route in the Static Route screen.

|  | dd New Static Route |
|--|---------------------|
| # Status Name Destination IP Subnet Mask/Prefix Length Gateway Interface | e Modify            |

- 4 Configure the Static Route Setup screen using the following settings:
  - Click the **Active** button to enable this static route. When the switch goes to the right, the function is enabled. Enter the **Route Name** as **R**.
  - Set IP Type to IPv4.
  - Enter the Destination IP Address 192.168.10.0 and IP Subnet Mask 255.255.255.0 for the destination, N2.
  - Click the Use Gateway IP Address button to enable this function. When the switch goes to the right, the function is enabled. Enter 192.168.1.253 (R's N1 address) in the Gateway IP Address field.
  - Select VDSL as the Use Interface.
  - Click OK.

Now **B** should be able to receive traffic from **A**. You may need to additionally configure **B**'s firewall settings to allow specific traffic to pass through.

| Add New Static Route        |              |        |           |      |         |          |              |

|---|----------|---|

# 10.4 Policy Route

By default, the Zyxel Device routes packets based on the shortest path to the destination address. Policy routes allow you to override the default behavior and route packets based on other criteria, such as the

source address. For example, you can use policy-based routing to direct traffic from specific users through specific connections or distribute traffic across multiple paths for load sharing. Policy-based routing is applied to outgoing packets before the default routing rules are applied.

The **Policy Route** screen let you view and configure routing policies on the Zyxel Device. Click **Network Setting** > **Routing** > **Policy Route** to open the following screen.

Figure 108 Network Setting > Routing > Policy Route

The following table describes the labels in this screen.

| LABEL                   | DESCRIPTION   |
|-------------------------|---|

# 10.5 RIP Overview

Routing Information Protocol (RIP, RFC 1058 and RFC 1389) allows the Zyxel Device to exchange routing information with other routers. To activate RIP for the WAN interface, select the supported RIP version and operation.

## 10.5.1 RIP

Click **Network Setting** > **Routing** > **RIP** to open the **RIP** screen. Select the desired RIP version and operation by clicking the check box. To stop RIP on the WAN interface, clear the check box. Click the **Apply** button to start or stop RIP and save the configuration.

Figure 110 Network Setting > Routing > RIP

|   | ckbox. To stop RIP on<br>e the configuration. | the WAN Interface, u | ncheck the Enabled chec | kbox. Click the Ap | ply button to start/stop RIP and |
|---|---|----------------------|-------------------------|--------------------|----------------------------------|
| # | Interface                                     | Version              | Operation               | Enable             | Disable Default Gateway          |
| 1 | Cellular WAN                                  | RIPV                 | Active                  |                    |                                  |
| 2 | ETHWAN  | RIPv2                | Active                  |                    |                                  |

The following table describes the labels in this screen.

| LABEL                      | DESCRIPTION  |
|----------------------------|--|
| #                          | This is the index of the interface in which the RIP setting is used.   |
| Interface                  | This is the name of the interface in which the RIP setting is used.  |
| Version                    | The RIP version controls the format and the broadcasting method of the RIP packets that the Zyxel Device sends (it recognizes both formats when receiving). <b>RIPv1</b> is universally supported but <b>RIPv2</b> carries more information. <b>RIPv1</b> is probably adequate for most networks, unless you have an unusual network topology. When set to <b>Both</b> , the Zyxel Device will broadcast its routing table periodically and incorporate the RIP information that it receives |
| Operation                  | Select <b>Passive</b> to have the Zyxel Device update the routing table based on the RIP packets received from neighbors but not advertise its route information to other routers in this interface. Select <b>Active</b> to have the Zyxel Device advertise its route information and also listen for routing updates from neighboring routers.   |
| Enable                     | Select the check box to activate the settings.   |
| Disable Default<br>Gateway | Select the check box to set the Zyxel Device to not send the route information to the default gateway.   |
| Cancel                     | Click Cancel to exit this screen without saving.   |
| Apply                      | Click <b>Apply</b> to save your changes back to the Zyxel Device.  |

#### Table 59 Network Setting > Routing > RIP

# CHAPTER 11 Quality of Service (QoS)

# 11.1 QoS Overview

Quality of Service (QoS) refers to both a network's ability to deliver data with minimum delay, and the networking methods used to control the use of bandwidth. Without QoS, all traffic data is equally likely to be dropped when the network is congested. This can cause a reduction in network performance and make the network inadequate for time-critical applications such as video-on-demand.

Configure QoS on the Zyxel Device to group and prioritize application traffic and fine-tune network performance. Setting up QoS involves these steps:

- 1 Configure classifiers to sort traffic into different flows.
- 2 Assign priority and define actions to be performed for a classified traffic flow.

The Zyxel Device assigns each packet a priority and then queues the packet accordingly. Packets assigned a high priority are processed more quickly than those with low priority if there is congestion, allowing time-sensitive applications to flow more smoothly. Time-sensitive applications include both those that require a low level of latency (delay) and a low level of jitter (variations in delay) such as Voice over IP (VoIP) or Internet gaming, and those for which jitter alone is a problem such as Internet radio or streaming video. There are eight priority levels, with 1 having the highest priority.

This chapter contains information about configuring QoS and editing classifiers.

## 11.1.1 What You Can Do in this Chapter

• The **QoS** screen lets you enable or disable QoS and set the upstream bandwidth (Section 11.3 on page 181).

# 11.2 What You Need to Know

The following terms and concepts may help as you read through this chapter.

#### QoS versus CoS

QoS is used to prioritize source-to-destination traffic flows. All packets in the same flow are given the same priority. CoS (class of service) is a way of managing traffic in a network by grouping similar types of traffic together and treating each type as a class. You can use CoS to give different priorities to different packet types.

CoS technologies include IEEE 802.1p layer 2 tagging and DiffServ (Differentiated Services or DS). IEEE 802.1p tagging makes use of 3 bits in the packet header, while DiffServ is a new protocol and defines a new DS field, which replaces the eight-bit ToS (Type of Service) field in the IP header.

## Tagging and Marking

In a QoS class, you can configure whether to add or change the DSCP (DiffServ Code Point) value, IEEE 802.1p priority level and VLAN ID number in a matched packet. When the packet passes through a compatible network, the networking device, such as a backbone switch, can provide specific treatment or service based on the tag or marker.

## Traffic Shaping

Bursty traffic may cause network congestion. Traffic shaping regulates packets to be transmitted with a pre-configured data transmission rate using buffers (or queues). Your Zyxel Device uses the Token Bucket algorithm to allow a certain amount of large bursts while keeping a limit at the average rate.

### **Traffic Policing**

Traffic policing is the limiting of the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Traffic policing methods measure traffic flows against user-defined criteria and identify it as either conforming, exceeding or violating the criteria.

The Zyxel Device supports three incoming traffic metering algorithms: Token Bucket Filter (TBF), Single Rate Two Color Maker (srTCM), and Two Rate Two Color Marker (trTCM). You can specify actions which are performed on the colored packets. See Section 11.4 on page 183 for more information on each metering algorithm.

## **Strictly Priority**

Strictly Priority (SP) services queues based on priority only. As traffic comes into the Switch, traffic on the highest priority queue, Q7 is transmitted first. When that queue empties, traffic on the next highest priority queue, Q6 is transmitted until Q6 empties, and then traffic is transmitted on Q5 and so on. If higher priority queues never empty, then traffic on lower priority queues never gets sent. SP does not automatically adapt to changing network requirements.

## Weighted Round Robin Schedule (WRR)

Round Robin Scheduling services queues on a rotating basis and is activated only when a port has more traffic than it can handle. A queue is given an amount of bandwidth irrespective of the incoming traffic on that port. This queue then moves to the back of the list. The next queue is given an equal amount of bandwidth, and then moves to the end of the list; and so on, depending on the number of queues being used. This works in a looping fashion until a queue is empty.

Weighted Round Robin Scheduling (WRR) uses the same algorithm as round robin scheduling, but services queues based on their priority and queue weight (the number you configure in the queue **Weight** field) rather than a fixed amount of bandwidth. WRR is activated only when a port has more traffic than it can handle. Queues with larger weights get more service than queues with smaller weights. This queuing mechanism is highly efficient in that it divides any available bandwidth across the different traffic queues and returns to queues that have not yet emptied.

# 11.3 Quality of Service General Settings

Use this screen to enable or disable QoS and set the upstream bandwidth or assign traffic priority. See Section 11.1 on page 179 for more information.

When one of the following situations happens, the current WAN linkup rate will be used instead:

- 1 WAN Managed Upstream Bandwidth is set to 0
- 2 WAN Managed Upstream Bandwidth is empty
- 3 WAN Managed Upstream Bandwidth is higher than the current WAN interface linkup rate

Note: Manually defined QoS is ignored when Upstream Traffic Priority is selected.

- Note: Upstream Traffic Priority automatically assigns a traffic priority level based on the selected criteria.
- Note: To have your QoS settings configured in other **QoS** screens take effect, select **None** in the **Upstream Traffic Priority Assigned by** field.

Click **Network Setting > QoS > General** to open the screen as shown next.

| Figure 111   | Network Setting > | $Q_0S > General$ |
|--------------|-------------------|------------------|
| inguie i i i | Nerwork Sering -  | QU2 > General    |

|   |                                     | QoS                                  |  |

| QoS                                  | Click this switch to enable QoS to improve your network performance.  |
| WAN Managed<br>Upstream<br>Bandwidth | Enter the amount of upstream bandwidth for the WAN interfaces that you want to allocate using QoS.  |
| Banawiain                            | The recommendation is to set this speed to match the interfaces' actual transmission speed. For example, set the WAN interfaces' speed to 100000 kbps if your Internet connection has an upstream transmission speed of 100 Mbps. |
|                                      | You can also set this number lower than the interfaces' actual transmission speed. This will cause the Zyxel Device to not use some of the interfaces' available bandwidth.   |
|                                      | If you leave this field blank, the Zyxel Device automatically sets this number to be 95% of the WAN interfaces' actual upstream transmission speed.   |
| LAN Managed<br>Downstream            | Enter the amount of downstream bandwidth for the LAN interfaces (including WLAN) that you want to allocate using QoS.   |
| Bandwidth                            | The recommendation is to set this speed to match the WAN interfaces' actual transmission speed. For example, set the LAN managed downstream bandwidth to 100000 kbps if you use a 100 Mbps wired Ethernet WAN connection.         |
|                                      | You can also set this number lower than the WAN interfaces' actual transmission speed. This will cause the Zyxel Device to not use some of the interfaces' available bandwidth.   |
|                                      | If you leave this field blank, the Zyxel Device automatically sets this to the LAN interfaces' maximum supported connection speed.  |
| Cancel                               | Click Cancel to restore your previously saved settings.   |
| Apply                                | Click Apply to save your changes.   |

# 11.4 Technical Reference

The following section contains additional technical information about the Zyxel Device features described in this chapter.

## IEEE 802.1Q Tag

The IEEE 802.1Q standard defines an explicit VLAN tag in the MAC header to identify the VLAN membership of a frame across bridges. A VLAN tag includes the 12-bit VLAN ID and 3-bit user priority. The VLAN ID associates a frame with a specific VLAN and provides the information that devices need to process the frame across the network.

IEEE 802.1p specifies the user priority field and defines up to eight separate traffic types. The following table describes the traffic types defined in the IEEE 802.1d standard (which incorporates the 802.1p).

| PRIORITY LEVEL | TRAFFIC TYPE  |
|----------------|---|
| Level 7        | Typically used for network control traffic such as router configuration messages.   |
| Level 6        | Typically used for voice traffic that is especially sensitive to jitter (jitter is the variations in delay).  |
| Level 5        | Typically used for video that consumes high bandwidth and is sensitive to jitter.   |
| Level 4        | Typically used for controlled load, latency-sensitive traffic such as SNA (Systems Network Architecture) transactions.  |
| Level 3        | Typically used for "excellent effort" or better than best effort and would include important business traffic that can tolerate some delay.                   |
| Level 2        | This is for "spare bandwidth".  |
| Level 1        | This is typically used for non-critical "background" traffic such as bulk transfers that are allowed but that should not affect other applications and users. |
| Level 0        | Typically used for best-effort traffic.   |

Table 61 IEEE 802.1p Priority Level and Traffic Type

## DiffServ

QoS is used to prioritize source-to-destination traffic flows. All packets in the flow are given the same priority. You can use CoS (class of service) to give different priorities to different packet types.

DiffServ (Differentiated Services) is a class of service (CoS) model that marks packets so that they receive specific per-hop treatment at DiffServ-compliant network devices along the route based on the application types and traffic flow. Packets are marked with DiffServ Code Points (DSCPs) indicating the level of service desired. This allows the intermediary DiffServ-compliant network devices to handle the packets differently depending on the code points without the need to negotiate paths or remember state information for every flow. In addition, applications do not have to request a particular service or give advanced notice of where the traffic is going.

## **DSCP and Per-Hop Behavior**

DiffServ defines a new Differentiated Services (DS) field to replace the Type of Service (TOS) field in the IP header. The DS field contains a 2-bit unused field and a 6-bit DSCP field which can define up to 64 service levels. The following figure illustrates the DS field.

DSCP is backward compatible with the three precedence bits in the ToS octet so that non-DiffServ compliant, ToS-enabled network device will not conflict with the DSCP mapping.

| DSCP (6 bits) | Unused (2 bits) |
|---------------|-----------------|
|---------------|-----------------|

The DSCP value determines the forwarding behavior, the PHB (Per-Hop Behavior), that each packet gets across the DiffServ network. Based on the marking rule, different kinds of traffic can be marked for different kinds of forwarding. Resources can then be allocated according to the DSCP values and the configured policies.

## **IP Precedence**

Similar to IEEE 802.1 p prioritization at layer-2, you can use IP precedence to prioritize packets in a layer-3 network. IP precedence uses three bits of the eight-bit ToS (Type of Service) field in the IP header. There are eight classes of services (ranging from zero to seven) in IP precedence. Zero is the lowest priority level and seven is the highest.

## Automatic Priority Queue Assignment

If you enable QoS on the Zyxel Device, the Zyxel Device can automatically base on the IEEE 802.1p priority level, IP precedence and/or packet length to assign priority to traffic which does not match a class.

The following table shows you the internal layer-2 and layer-3 QoS mapping on the Zyxel Device. On the Zyxel Device, traffic assigned to higher priority queues gets through faster while traffic in lower index queues is dropped if the network is congested.

|                   | LAYER 2   | LAYER 3                |        |                            |
|-------------------|---|------------------------|--------|----------------------------|
| Priority<br>Queue | IEEE 802.1P USER<br>PRIORITY (ETHERNET<br>PRIORITY) | TOS (IP<br>PRECEDENCE) | DSCP   | IP PACKET LENGTH<br>(BYTE) |
| 0                 | 1   | 0                      | 000000 |                            |
| 1                 | 2   |                        |        |                            |
| 2                 | 0   | 0                      | 000000 | >1100                      |
| 3                 | 3   | 1                      | 001110 | 250 – 1100                 |
|                   |   |                        | 001100 |                            |
|                   |   |                        | 001010 |                            |
|                   |   |                        | 001000 |                            |

#### Token Bucket

The token bucket algorithm uses tokens in a bucket to control when traffic can be transmitted. The bucket stores tokens, each of which represents one byte. The algorithm allows bursts of up to *b* bytes which is also the bucket size, so the bucket can hold up to *b* tokens. Tokens are generated and added into the bucket at a constant rate. The following shows how tokens work with packets:

- A packet can be transmitted if the number of tokens in the bucket is equal to or greater than the size of the packet (in bytes).
- After a packet is transmitted, a number of tokens corresponding to the packet size is removed from the bucket.
- If there are no tokens in the bucket, the Zyxel Device stops transmitting until enough tokens are generated.
- If not enough tokens are available, the Zyxel Device treats the packet in either one of the following ways:

In traffic shaping:

• Holds it in the queue until enough tokens are available in the bucket.

In traffic policing:

- Drops it.
- Transmits it but adds a DSCP mark. The Zyxel Device may drop these marked packets if the network is overloaded.

Configure the bucket size to be equal to or less than the amount of the bandwidth that the interface can support. It does not help if you set it to a bucket size over the interface's capability. The smaller the bucket size, the lower the data transmission rate and that may cause outgoing packets to be dropped. A larger transmission rate requires a big bucket size. For example, use a bucket size of 10 kbytes to get the transmission rate up to 10 Mbps.

#### Single Rate Three Color Marker

The Single Rate Three Color Marker (srTCM, defined in RFC 2697) is a type of traffic policing that identifies packets by comparing them to one user-defined rate, the Committed Information Rate (CIR), and two burst sizes: the Committed Burst Size (CBS) and Excess Burst Size (EBS).

The srTCM evaluates incoming packets and marks them with one of three colors which refer to packet loss priority levels. High packet loss priority level is referred to as red, medium is referred to as yellow and low is referred to as green.

The srTCM is based on the token bucket filter and has two token buckets (CBS and EBS). Tokens are generated and added into the bucket at a constant rate, called Committed Information Rate (CIR). When the first bucket (CBS) is full, new tokens overflow into the second bucket (EBS).

All packets are evaluated against the CBS. If a packet does not exceed the CBS it is marked green. Otherwise it is evaluated against the EBS. If it is below the EBS then it is marked yellow. If it exceeds the EBS then it is marked red.

The following shows how tokens work with incoming packets in srTCM:

- A packet arrives. The packet is marked green and can be transmitted if the number of tokens in the CBS bucket is equal to or greater than the size of the packet (in bytes).
- After a packet is transmitted, a number of tokens corresponding to the packet size is removed from the CBS bucket.
- If there are not enough tokens in the CBS bucket, the Zyxel Device checks the EBS bucket. The packet is marked yellow if there are sufficient tokens in the EBS bucket. Otherwise, the packet is marked red. No tokens are removed if the packet is dropped.

#### Two Rate Three Color Marker

The Two Rate Three Color Marker (trTCM, defined in RFC 2698) is a type of traffic policing that identifies packets by comparing them to two user-defined rates: the Committed Information Rate (CIR) and the Peak Information Rate (PIR). The CIR specifies the average rate at which packets are admitted to the network. The PIR is greater than or equal to the CIR. CIR and PIR values are based on the guaranteed and maximum bandwidth respectively as negotiated between a service provider and client.

The trTCM evaluates incoming packets and marks them with one of three colors which refer to packet loss priority levels. High packet loss priority level is referred to as red, medium is referred to as yellow and low is referred to as green.

The trTCM is based on the token bucket filter and has two token buckets (Committed Burst Size (CBS) and Peak Burst Size (PBS)). Tokens are generated and added into the two buckets at the CIR and PIR respectively.

All packets are evaluated against the PIR. If a packet exceeds the PIR it is marked red. Otherwise it is evaluated against the CIR. If it exceeds the CIR then it is marked yellow. Finally, if it is below the CIR then it is marked green.

The following shows how tokens work with incoming packets in trTCM:

- A packet arrives. If the number of tokens in the PBS bucket is less than the size of the packet (in bytes), the packet is marked red and may be dropped regardless of the CBS bucket. No tokens are removed if the packet is dropped.
- If the PBS bucket has enough tokens, the Zyxel Device checks the CBS bucket. The packet is marked green and can be transmitted if the number of tokens in the CBS bucket is equal to or greater than the size of the packet (in bytes). Otherwise, the packet is marked yellow.

# CHAPTER 12 Network Address Translation (NAT)

# 12.1 NAT Overview

NAT (Network Address Translation – NAT, RFC 1631) is the translation of the IP address of a host in a packet, for example, the source address of an outgoing packet, used within one network to a different IP address known within another network.

# 12.1.1 What You Can Do in this Chapter

- Use the **Port Forwarding** screen to configure forward incoming service requests to the servers on your local network (Section 12.2 on page 188).
- Use the **Port Triggering** screen to add and configure the Zyxel Device's trigger port settings (Section 12.3 on page 191).
- Use the DMZ screen to configure a default server (Section 12.4 on page 194).
- Use the ALG screen to enable or disable the SIP ALG (Section 12.5 on page 195).

# 12.1.2 What You Need To Know

The following terms and concepts may help as you read this chapter.

#### Inside/Outside and Global/Local

Inside/outside denotes where a host is located relative to the Zyxel Device, for example, the computers of your subscribers are the inside hosts, while the web servers on the Internet are the outside hosts.

Global/local denotes the IP address of a host in a packet as the packet traverses a router, for example, the local address refers to the IP address of a host when the packet is in the local network, while the global address refers to the IP address of the host when the same packet is traveling in the WAN side.

#### NAT

In the simplest form, NAT changes the source IP address in a packet received from a subscriber (the inside local address) to another (the inside global address) before forwarding the packet to the WAN side. When the response comes back, NAT translates the destination address (the inside global address) back to the inside local address before forwarding it to the original inside host.

## Port Forwarding

A port forwarding set is a list of inside (behind NAT on the LAN) servers, for example, web or FTP, that you can make visible to the outside world even though NAT makes your whole inside network appear as a single computer to the outside world.

# 12.2 Port Forwarding

Use **Port Forwarding** to forward incoming service requests from the Internet to the servers on your local network. Port forwarding is commonly used when you want to host online gaming, P2P file sharing, or other servers on your network.

You may enter a single port number or a range of port numbers to be forwarded, and the local IP address of the desired server. The port number identifies a service; for example, web service is on port 80 and FTP on port 21. In some cases, such as for unknown services or where one server can support more than one service (for example both FTP and web service), it might be better to specify a range of port numbers. You can allocate a server IP address that corresponds to a port or a range of ports. Please refer to RFC 1700 for further information about port numbers.

Note: Many residential broadband ISP accounts do not allow you to run any server processes (such as a Web or FTP server) from your location. Your ISP may periodically check for servers and may suspend your account if it discovers any active services at your location. If you are unsure, refer to your ISP.

#### Configure Servers Behind Port Forwarding (Example)

Let's say you want to assign ports 21-25 to one FTP, Telnet and SMTP server (**A** in the example), port 80 to another (**B** in the example), a default server IP address of 192.168.1.35 to a third (**C** in the example), and a default server IP address of 192.168.1.36 to a fourth (**D** in the example). You assign the LAN IP addresses and the ISP assigns the WAN IP address. The NAT network appears as a single host on the Internet.

Figure 112 Multiple Servers Behind NAT Example

# 12.2.1 Port Forwarding

Click Network Setting > NAT to open the Port Forwarding screen.

Note: TCP port 7547 is reserved for system use.

Figure 113 Network Setting > NAT > Port Forwarding

|  | ng, you need to have the same configurations in the Start Port, End Port, Translation Start Port, an      |
| To configure port translatio<br>Translation End Port fields.                         | n, you need to have different configurations in the Start Port, End Port, Translation Start Port, and     |
| 3) TCP port 7547 is reserved fo  | or system use.  |

Figure 114 Network Setting > NAT > Port Forwarding: Add or Edit

Note: To configure port forwarding, you need to have the same configurations in the Start Port, End Port, Translation Start Port, and Translation End Port fields. To configure port translation, you need to have different configurations in the Start Port, End Port, Translation Start Port, and Translation End Port fields. Here is an example to configure port translation. Configure Start Port to 100, End Port to 120, Translation Start Port to 200, and Translation End Port to 220.

Note: TCP port 7547 is reserved for system use.

The following table describes the labels in this screen.

| Configure<br>Originating IP | Click the <b>Enable</b> check box to enter the source IP in the next field.   |
| Originating IP              | Enter the source IP address here.   |
| Protocol                    | Select the protocol supported by this virtual server. Choices are TCP, UDP, or TCP/UDP.   |
| OK                          | Click this to save your changes.  |
| Cancel                      | Click this to exit this screen without saving.  |

Table 64 Network Setting > NAT > Port Forwarding: Add or Edit (continued)

# 12.3 Port Triggering

Some services use a dedicated range of ports on the client side and a dedicated range of ports on the server side. With regular port forwarding, you set a forwarding port in NAT to forward a service (coming in from the server on the WAN) to the IP address of a computer on the client side (LAN). The problem is that port forwarding only forwards a service to a single LAN IP address. In order to use the same service on a different LAN computer, you have to manually replace the LAN computer's IP address in the forwarding port with another LAN computer's IP address.

Trigger port forwarding allows computers on the LAN to dynamically take turns using the service.

The Zyxel Device records the IP address of a LAN computer that sends traffic to the WAN to request a service with a specific port number and protocol (a \"trigger\" port). When the Zyxel Device's WAN port receives a response with a specific port number and protocol (\"open\" port), the Zyxel Device forwards the traffic to the LAN IP address of the computer that sent the request. After that computer's connection for that service closes, another computer on the LAN can use the service in the same manner. This way you do not need to configure a new IP address each time you want a different LAN computer to use the application.

For example:

#### Figure 115 Trigger Port Forwarding Process: Example

- 1 Jane requests a file from the Real Audio server (port 7070).
- 2 Port 7070 is a "trigger" port and causes the Zyxel Device to record Jane's computer IP address. The Zyxel Device associates Jane's computer IP address with the "open" port range of 6970 7170.
- 3 The Real Audio server responds using a port number ranging between 6970 7170.
- 4 The Zyxel Device forwards the traffic to Jane's computer IP address.
- 5 Only Jane can connect to the Real Audio server until the connection is closed or times out. The Zyxel Device times out in 3 minutes with UDP (User Datagram Protocol) or 2 hours with TCP/IP (Transfer Control Protocol/Internet Protocol).

Click **Network Setting > NAT > Port Triggering** to open the following screen. Use this screen to view your Zyxel Device's trigger port settings.

Note: TCP port 7547 is reserved for system use.

Note: The sum of trigger ports in all rules must be less than 1000 and every open port range must be less than 1000. When the protocol is TCP/UDP, the ports are counted twice.

| Service Name       | Enter a name to identify this rule. Up to 256 printable ASCII characters are allowed except [ " ], [ ` ], [ ' ], [ < ], [ > ], [ ^ ], [ \$ ], [   ], [ & ], or [ ; ].  |  |  |  |
| WAN Interface      | Select a WAN interface for which you want to configure port triggering rules.  |  |  |  |
| Trigger Start Port | The trigger port is a port (or a range of ports) that causes (or triggers) the Zyxel Device to record the IP address of the LAN computer that sent the traffic to a server on the WAN.   |  |  |  |
|                    | Enter a port number or the starting port number in a range of port numbers.  |  |  |  |
| Trigger End Port   | Enter a port number or the ending port number in a range of port numbers.  |  |  |  |
| Trigger Protocol   | Select the transport layer protocol from TCP, UDP, or TCP/UDP.   |  |  |  |
| Open Start Port    | The open port is a port (or a range of ports) that a server on the WAN uses when it sends out a particular service. The Zyxel Device forwards the traffic with this port (or range of ports) to the client computer on the LAN that requested the service. |  |  |  |
|                    | Enter a port number or the starting port number in a range of port numbers.  |  |  |  |
| Open End Port      | Enter a port number or the ending port number in a range of port numbers.  |  |  |  |
| Open Protocol      | Select the transport layer protocol from TCP, UDP, or TCP/UDP.   |  |  |  |
| Cancel             | Click <b>Cancel</b> to exit this screen without saving.  |  |  |  |
| ОК                 | Click <b>OK</b> to save your changes.  |  |  |  |

# 12.4 DMZ

Use this screen to specify the IP address of a default server to receive packets from ports not specified in the **Port Triggering** screen. The DMZ (DeMilitarized Zone) is a network between the WAN and the LAN that is accessible to devices on both the WAN and LAN with firewall protection. Devices on the WAN can initiate connections to devices on the DMZ but not to those on the LAN.

You can put public servers, such as email, web, and FTP servers, on the DMZ to provide services on both the WAN and LAN. To use this feature, you first need to assign a DMZ host. Click **Network Setting** > **NAT** > **DMZ** to open the **DMZ** screen.

Note: Use an IPv4 address for the DMZ server.

Note: Enter the IP address of the default server in the **Default Server Address** field, and click **Apply** to activate the DMZ host. Otherwise, clear the IP address in the **Default Server Address** field, and click **Apply** to deactivate the DMZ host.

#### Figure 118 Network Setting > NAT > DMZ

|  |                  |                   |                   |                 |                     |
|  | Ca               | ncel              | Apply             |                 |                     |
|  |                  |                   |                   |                 |                     |

The following table describes the fields in this screen.

Table 67 Network Setting > NAT > DMZ

| LABEL                     | DESCRIPTION  |
|---------------------------|--|
| Default Server<br>Address | Enter the IP address of the default server which receives packets from ports that are not specified in the <b>Port Forwarding</b> screen.                |
|                           | Note: If you do not assign a default server, the Zyxel Device discards all packets received for ports not specified in the virtual server configuration. |
| Apply                     | Click this to save your changes back to the Zyxel Device.  |
| Cancel                    | Click Cancel to restore your previously saved settings.  |

# 12.5 ALG

Application Layer Gateway (ALG) allows customized NAT traversal filters to support address and port translation for certain applications such as File Transfer Protocol (FTP), Session Initiation Protocol (SIP), or file transfer in Instant Messaging (IM) applications. It allows SIP calls to pass through the Zyxel Device. When the Zyxel Device registers with the SIP register server, the SIP ALG translates the Zyxel Device's private IP address inside the SIP data stream to a public IP address. You do not need to use STUN or an outbound proxy if your Zyxel Device is behind a SIP ALG.

Click **Network Setting > NAT > ALG** to open the **ALG** screen. Use this screen to enable and disable the NAT Application Layer Gateway (ALG) in the Zyxel Device.

Application Layer Gateway (ALG) allows certain applications such as File Transfer Protocol (FTP), Session Initiation Protocol (SIP), or file transfer in Instant Messaging (IM) applications to pass through the Zyxel Device.

The following table describes the fields in this screen.

| Table 48 | Notwork Sotting $> NAT > ALC$ |
|----------|-------------------------------|
|          | Network Setting > NAT > ALG   |

| LABEL    | DESCRIPTION  |
|----------|--|
| SIP ALG  | Click this switch to enable SIP ALG to make sure SIP (VoIP) works correctly with port-forwarding and address-mapping rules.                      |
| PPTP ALG | Click this switch to enable the PPTP ALG on the Zyxel Device to detect PPTP traffic and help build PPTP sessions through the Zyxel Device's NAT. |
| Apply    | Click <b>Apply</b> to save your changes back to the Zyxel Device.  |
| Cancel   | Click Cancel to restore your previously saved settings.  |

# 12.6 Technical Reference

This part contains more information regarding NAT.

## 12.6.1 NAT Definitions

Inside or outside denotes where a host is located relative to the Zyxel Device, for example, the computers of your subscribers are the inside hosts, while the web servers on the Internet are the outside hosts.

Global or local denotes the IP address of a host in a packet as the packet traverses a router, for example, the local address refers to the IP address of a host when the packet is in the local network, while the global address refers to the IP address of the host when the same packet is traveling in the WAN side.

Note that inside or outside refers to the location of a host, while global/local refers to the IP address of a host used in a packet. Thus, an inside local address (ILA) is the IP address of an inside host in a packet when the packet is still in the local network, while an inside global address (IGA) is the IP address of the same inside host when the packet is on the WAN side. The following table summarizes this information.

| ITEM    | DESCRIPTION                         |
|---------|-------------------------------------|
| Inside  | This refers to the host on the LAN. |
| Outside | This refers to the host on the WAN. |

Table 69 NAT Definitions

| ITEM   | DESCRIPTION   |
|--------|---|
| Local  | This refers to the packet address (source or destination) as the packet travels on the LAN. |
| Global | This refers to the packet address (source or destination) as the packet travels on the WAN. |

 Table 69
 NAT Definitions (continued)

NAT never changes the IP address (either local or global) of an outside host.

# 12.6.2 What NAT Does

In the simplest form, NAT changes the source IP address in a packet received from a subscriber (the inside local address) to another (the inside global address) before forwarding the packet to the WAN side. When the response comes back, NAT translates the destination address (the inside global address) back to the inside local address before forwarding it to the original inside host. Note that the IP address (either local or global) of an outside host is never changed.

The global IP addresses for the inside hosts can be either static or dynamically assigned by the ISP. In addition, you can designate servers, for example, a web server and a telnet server, on your local network and make them accessible to the outside world. If you do not define any servers (for Many-to-One and Many-to-Many Overload mapping), NAT offers the additional benefit of firewall protection. With no servers defined, your Zyxel Device filters out all incoming inquiries, thus preventing intruders from probing your network. For more information on IP address translation, refer to *RFC 1631, The IP Network Address Translator (NAT)*.

# 12.6.3 How NAT Works

Each packet has two addresses – a source address and a destination address. For outgoing packets, the ILA (Inside Local Address) is the source address on the LAN, and the IGA (Inside Global Address) is the source address on the WAN. For incoming packets, the ILA is the destination address on the LAN, and the IGA is the destination address on the WAN. NAT maps private (local) IP addresses to globally unique ones required for communication with hosts on other networks. It replaces the original IP source address (and TCP or UDP source port numbers for Many-to-One and Many-to-Many Overload NAT mapping) in each packet and then forwards it to the Internet. The Zyxel Device keeps track of the original addresses and port numbers so incoming reply packets can have their original values restored. The following figure illustrates this.

12.6.4 NAT Application

The following figure illustrates a possible NAT application, where three inside LANs (logical LANs using IP alias) behind the Zyxel Device can communicate with three distinct WAN networks.

#### NR/FWA Indoor Series User's Guide

### Port Forwarding: Services and Port Numbers

The most often used port numbers are shown in the following table. Please refer to RFC 1700 for further information about port numbers. Please also refer to the Supporting CD for more examples and details on port forwarding and NAT.

Table 70 Services and Port Numbers

| SERVICES  | PORT NUMBER |
|---|-------------|
| ECHO  | 7           |
| FTP (File Transfer Protocol)                    | 21          |
| SMTP (Simple Mail Transfer Protocol)            | 25          |
| DNS (Domain Name System)                        | 53          |
| Finger  | 79          |
| HTTP (Hyper Text Transfer protocol or WWW, Web) | 80          |
| POP3 (Post Office Protocol)                     | 110         |
| NNTP (Network News Transport Protocol)          | 119         |
| SNMP (Simple Network Management Protocol)       | 161         |
| SNMP trap                                       | 162         |
| PPTP (Point-to-Point Tunneling Protocol)        | 1723        |

#### Port Forwarding Example

Let's say you want to assign ports 21 – 25 to one FTP, Telnet and SMTP server (**A** in the example), port 80 to another (**B** in the example) and assign a default server IP address of 192.168.1.35 to a third (**C** in the example). You assign the LAN IP addresses and the ISP assigns the WAN IP address. The NAT network appears as a single host on the Internet.

# Chapter 13 DNS

# 13.1 DNS Overview

## DNS

DNS (Domain Name System) is for mapping a domain name to its corresponding IP address and vice versa. The DNS server is extremely important because without it, you must know the IP address of a machine before you can access it.

In addition to the system DNS servers, each WAN interface (service) is set to have its own static or dynamic DNS server list. You can configure a DNS static route to forward DNS queries for certain domain names through a specific WAN interface to its DNS servers. The Zyxel Device uses a system DNS server (in the order you specify in the **Broadband** screen) to resolve domain names that do not match any DNS routing entry. After the Zyxel Device receives a DNS reply from a DNS server, it creates a new entry for the resolved IP address in the routing table.

Note: For information on configuring DNS route, see Chapter 10 on page 169.

## **Dynamic DNS**

Dynamic DNS allows you to use a dynamic IP address with one or many dynamic DNS services so that anyone can contact you (in NetMeeting, CU-SeeMe, etc.). You can also access your FTP server or Web site on your own computer using a domain name (for instance myhost.dhs.org, where myhost is a name of your choice) that will never change instead of using an IP address that changes each time you reconnect. Your friends or relatives will always be able to call you even if they do not know your IP address.

You first need to have registered a dynamic DNS account with www.dyndns.org. This is for people with a dynamic IP from their ISP or DHCP server that would still like to have a domain name. The Dynamic DNS service provider will give you a password or key.

# 13.1.1 What You Can Do in this Chapter

- Use the DNS Entry screen to view, configure, or remove DNS routes (Section 13.2 on page 201).
- Use the **Dynamic DNS** screen to enable DDNS and configure the DDNS settings on the Zyxel Device (Section 13.3 on page 202).

200

## 13.1.2 What You Need To Know

#### **DYNDNS Wildcard**

Enabling the wildcard feature for your host causes \*.yourhost.dyndns.org to be aliased to the same IP address as yourhost.dyndns.org. This feature is useful if you want to be able to use, for example, www.yourhost.dyndns.org and still reach your hostname.

If you have a private WAN IP address, then you cannot use Dynamic DNS.

# 13.2 DNS Entry

DNS (Domain Name System) is used for mapping a domain name to its corresponding IP address and vice versa. Use this screen to view and configure manual DNS entires on the Zyxel Device. Click **Network Setting > DNS** to open the **DNS Entry** screen.

Note: The host name should consist of the host's local name and the domain name. For example, Mycomputer.home is a host name where Mycomputer is the host's local name, and .home is the domain name.

|   |          |            | + Add New DNS E |
|---|----------|------------|-----------------|
| # | HostName | IP Address | Modify          |
| # | HostName | IP Address | Modify          |
|   |          |            |                 |
|   |          |            |                 |
|   |          |            |                 |

| LABEL             | DESCRIPTION  |
|-------------------|--|
| Add New DNS Entry | Click this to create a new DNS entry.                    |
| #                 | This is the index number of the entry.                   |
| HostName          | This indicates the host name or domain name.             |
| IP Address        | This indicates the IP address assigned to this computer. |
| Modify            | Click the Edit icon to edit the rule.                    |
|                   | Click the <b>Delete</b> icon to delete an existing rule. |

The following table describes the fields in this screen.

Table 71 Network Setting > DNS > DNS Entry

# 13.2.1 Add or Edit DNS Entry

You can manually add or edit the Zyxel Device's DNS name and IP address entry. Click Add New DNS Entry in the DNS Entry screen or the Edit icon next to the entry you want to edit. The screen shown next appears.

Figure 124 Network Setting > DNS > DNS Entry: Add or Edit

| <                         | Add New DNS Entry |  |
|---------------------------|-------------------|--|
| Host Name<br>IPv4 Address | · · ·             |  |
|                           | Cancel QK         |  |

The following table describes the labels in this screen.

Table 72 Network Setting > DNS > DNS Entry: Add or Edit

| LABEL        | DESCRIPTION  |
|--------------|--|
| Host Name    | Enter the host name of the DNS entry. Up to 256 printable ASCII characters are allowed except [<br>"], [`], ['], [<], [>], [^], [\$], [], [\$], [], [&], or [;]. |
|              | You can use the wildcard character, an "*" (asterisk) as the left most part of a domain name, such as *.example.com.   |
| IPv4 Address | Enter the IPv4 address of the DNS entry.   |
| Cancel       | Click <b>Cancel</b> to exit this screen without saving.  |

# CHAPTER 14 USB Service

# 14.1 USB Service Overview

You can share files on a USB memory stick or hard drive connected to your Zyxel Device with users on your network.

The following figure is an overview of the Zyxel Device's file server feature. Computers **A** and **B** can access files on a USB device (**C**) which is connected to the Zyxel Device.

The Zyxel Device will not be able to join a workgroup if your local area network has restrictions set up that do not allow devices to join a workgroup. In this case, contact your network administrator.

# 14.1.1 What You Need To Know

The following terms and concepts may help as you read this chapter.

## 14.1.1.1 About File Sharing

#### Workgroup Name

This is the name given to a set of computers that are connected on a network and share resources such as a printer or files. Windows automatically assigns the workgroup name when you set up a network.

#### Shares

When settings are set to default, each USB device connected to the Zyxel Device is given a folder, called a "share". If a USB hard drive connected to the Zyxel Device has more than one partition, then each partition will be allocated a share. You can also configure a "share" to be a sub-folder or file on the USB device.

205

### **File Systems**

A file system is a way of storing and organizing files on your hard drive and storage device. Often different operating systems such as Windows or Linux have different file systems. The file sharing feature on your Zyxel Device supports File Allocation Table (FAT) and FAT32.

#### **Common Internet File System**

The Zyxel Device uses Common Internet File System (CIFS) protocol for its file sharing functions. CIFS compatible computers can access the USB file storage devices connected to the Zyxel Device. CIFS protocol is supported on Microsoft Windows, Linux Samba and other operating systems (refer to your systems specifications for CIFS compatibility).

# 14.1.2 Before You Begin

- 1 Make sure the Zyxel Device is connected to your network and turned on.
- 2 Connect the USB device to one of the Zyxel Device's USB port. If you are connecting a USB hard drive that comes with an external power supply, make sure it is connected to an appropriate power source.
- 3 The Zyxel Device detects the USB device and makes its contents available for browsing.

Note: If your USB device cannot be detected by the Zyxel Device, see the troubleshooting for suggestions.

# 14.2 USB Service

Use this screen to set up file sharing through the Zyxel Device. The Zyxel Device's LAN users can access the shared folder (or share) from the USB device inserted in the Zyxel Device. To access this screen, click **Network Setting** > **USB Service**.

|  |           | US   | B Service  |                                   |                 |

#### Figure 127 Network Setting > USB Service

Note: The **Share Directory List** is only visible when you connect a USB device.

Each field is described in the following table.

| LABEL                    | DESCRIPTION   |
|--------------------------|---|
| Information              |   |
| Volume                   | This is the volume name the Zyxel Device gives to an inserted USB device. |
| Capacity                 | This is the total available memory size (in megabytes) on the USB device. |
| Used Space               | This is the memory size (in megabytes) already used on the USB device.    |
| Server Configurat        | ion   |
| File Sharing<br>Services | Click this switch to enable file sharing through the Zyxel Device.        |
| Share Directory Li       | st  |
| This only appears        | when you have inserted a USB device.                                      |
| Add New Share            | Click this to set up a new share on the Zyxel Device.                     |
| Active                   | Select this to allow the share to be accessed.                            |
| Status                   | This field shows the status of the share                                  |
|                          | $\mathbf{\mathbb{Y}}$ : The share is not activated.                       |
|                          | <b>?</b> : The share is activated.  |

Table 74 Network Setting > USB Service

NR/FWA Indoor Series User's Guide

| LABEL                | DESCRIPTION  |
|----------------------|--|
| Share Name           | This field displays the name of the file you shared.   |
| Share Path           | This field displays the location in the USB of the file you shared.  |
| Share<br>Description | This field displays a description of the file you shared.  |
| Modify               | Click the Edit icon to change the settings of an existing share.   |
|                      | Click the <b>Delete</b> icon to delete this share in the list.   |
| Account Manag        | ement  |
| Add New User         | Click this button to create a user account to access the secured shares. This button redirects you to <b>Maintenance</b> > <b>User Account</b> . |
| Status               | This field shows the status of the user.   |
|                      | : The user account is not activated for the share.   |
|                      |  |
| User Name            | This is the name of a user who is allowed to access the secured shares on the USB device.  |
| Cancel               | Click this to restore your previously saved settings.  |
| Apply                | Click this to save your changes to the Zyxel Device.   |

Table 74 Network Setting > USB Service (continued)

## 14.2.1 Add New Share

Use this screen to set up a new share or edit an existing share on the Zyxel Device. Click Add New Share in the File Sharing screen or click the Edit or Modify icon next to an existing share.

Please note that you need to set up shared folders on the USB device before enabling file sharing in the Zyxel Device. Also, spaces and the following special characters listed in the brackets ["`<> $^{|`}<>^{|} &::/:*?'$ ] are not allowed for the USB share name.

| <            | Add N     | lew Share |
|--------------|-----------|-----------|
|              |           |           |
| Volume       | usb1_sda1 | -         |
| Share Path   |           | Browse    |
| Description  |           |           |
| Access Level | Security  | -         |

The following table describes the labels in this menu.

| Table 75 | Network Setting > USB Service > Add New Share |
|----------|---|
| 1001070  |   |

| LABEL        | DESCRIPTION  |
|--------------|--|
| Volume       | Select the volume in the USB storage device that you want to add as a share in the Zyxel Device.   |
|              | This field is read-only when you are editing the share.  |
| Share Path   | Manually enter the file path for the share, or click the <b>Browse</b> button and select the folder that you want to add as a share.                     |
|              | This field is read-only when you are editing the share.  |
| Description  | You can either enter a short description of the share, or leave this field blank.  |
| Access Level | Select <b>Public</b> if you want the share to be accessed by users connecting to the Zyxel Device.<br>Otherwise, select <b>Security</b> .                |
| Allowed      | If <b>Security</b> is selected in the <b>Access Level</b> field, select this check box to allow/prohibit access to the share.                            |
| User Name    | This field specifies the user for which the <b>Allowed</b> setting applies. Users can be added or modified in <b>Maintenance</b> > <b>User Account</b> . |
| Cancel       | Click Cancel to return to the previous screen.   |
| ОК           | Click <b>OK</b> to save your changes.  |

## 14.2.2 Add New User Screen

Once you click the Add New User button, you'll be directed to the User Account screen. To create a user account that can access the secured shares on the USB device, click the Add New Account button in the Network Setting > USB Service > User Account screen.

Please see Chapter 27 on page 288, for detailed information about User Account screen.

# Chapter 15 Firewall

# 15.1 Firewall Overview

This chapter shows you how to enable the Zyxel Device firewall. Use the firewall to protect your Zyxel Device and network from attacks by hackers on the Internet and control access to it. The firewall:

- allows traffic that originates from your LAN computers to go to all other networks.
- blocks traffic that originates on other networks from going to the LAN.

By default, the Zyxel Device blocks DoS attacks whether the firewall is enabled or disabled.

The following figure illustrates the firewall action. User **A** can initiate an IM (Instant Messaging) session from the LAN to the WAN (1). Return traffic for this session is also allowed (2). However other traffic initiated from the WAN is blocked (3 and 4).

Figure 129 Default Firewall Action

# 15.1.1 What You Need to Know About Firewall

#### SYN Attack

A SYN attack floods a targeted system with a series of SYN packets. Each packet causes the targeted system to issue a SYN-ACK response. While the targeted system waits for the ACK that follows the SYN-ACK, it queues up all outstanding SYN-ACK responses on a backlog queue. SYN-ACKs are moved off the queue only when an ACK comes back or when an internal timer terminates the three-way handshake. Once the queue is full, the system will ignore all incoming SYN requests, making the system unavailable for legitimate users.

210

#### DoS

Denial-of-Service (DoS) attacks are aimed at devices and networks with a connection to the Internet. Their goal is not to steal information, but to disable a device or network so users no longer have access to network resources. The Zyxel Device is pre-configured to automatically detect and thwart all known DoS attacks.

#### **DoS Thresholds**

For DoS attacks, the Zyxel Device uses thresholds to determine when to drop sessions that do not become fully established. These thresholds apply globally to all sessions. You can use the default threshold values, or you can change them to values more suitable to your security requirements.

#### DDoS

A Distributed Denial-of-Service (DDoS) attack is one in which multiple compromised systems attack a single target, thereby causing denial of service for users of the targeted system.

#### ICMP

Internet Control Message Protocol (ICMP) is a message control and error-reporting protocol between a host server and a gateway to the Internet. ICMP uses Internet Protocol (IP) datagrams, but the messages are processed by the TCP/IP software and directly apparent to the application user.

#### LAND Attack

In a LAND attack, hackers flood SYN packets into the network with a spoofed source IP address of the target system. This makes it appear as if the host computer sent the packets to itself, making the system unavailable while the target system tries to respond to itself.

#### Ping of Death

Ping of Death uses a 'ping' utility to create and send an IP packet that exceeds the maximum 65,536 bytes of data allowed by the IP specification. This may cause systems to crash, hang or reboot.

#### SPI

Stateful Packet Inspection (SPI) tracks each connection crossing the firewall and makes sure it is valid. Filtering decisions are based not only on rules but also context. For example, traffic from the WAN may only be allowed to cross the firewall in response to a request from the LAN.

# 15.2 Firewall

Use the firewall to protect your Zyxel Device and network from attacks by hackers on the Internet and control access to it.

## 15.2.1 What You Can Do in this Chapter

- Use the **General** screen to configure the security level of the firewall on the Zyxel Device (Section 15.3 on page 212).
- Use the **Protocol** screen to add or remove predefined Internet services and configure firewall rules (Section 15.4 on page 213).
- Use the Access Control screen to view and configure incoming or outgoing filtering rules (Section 15.5 on page 214).
- Use the **DoS** screen to activate protection against Denial of Service (DoS) attacks (Section 15.6 on page 217).

# 15.3 Firewall General Settings

Use the firewall to protect your Zyxel Device and network from attacks by hackers on the Internet and control access to it. Use this screen to set the security level of the firewall on the Zyxel Device. Firewall rules are grouped based on the direction of travel of packets. A higher firewall level means more restrictions on the Internet activities you can perform. Click **Security > Firewall > General** to display the following screen. Use the slider to select the level of firewall protection.

Figure 130 Security > Firewall > General

Note: LAN to WAN is your access to all Internet services. WAN to LAN is the access of other computers on the Internet to devices behind the Zyxel Device.

When the security level is set to **High**, Telnet, FTP, HTTP, HTTPS, DNS, IMAP, POP3, SMTP, and/or IPv6 ICMPv6 (Ping) traffic from the LAN are still allowed.

The following table describes the labels in this screen.

| LABEL            | DESCRIPTION  |
|------------------|--|
| IPv4<br>Firewall | Enable firewall protection when using <b>IPv4</b> (Internet Protocol version 4).   |
| IPv6<br>Firewall | Enable firewall protection when using IPv6 (Internet Protocol version 6).  |
| High             | This setting blocks all traffic to and from the Internet. Only local network traffic and LAN to WAN service (Telnet, FTP, HTTP, DNS, POP3, SMTP) is permitted.                           |
| Medium           | This is the recommended setting. It allows traffic to the Internet but blocks anyone from the Internet from accessing any services on your local network.                                |
| Low              | This setting allows traffic to the Internet and also allows someone from the Internet to access services on your local network. This would be used with Port Forwarding, Default Server. |
| Apply            | Click this to save your changes.   |
| Cancel           | Click this to restore your previously saved settings.  |

Table 76 Security > Firewall > General

# 15.4 Protocol (Customized Services)

You can configure customized services and port numbers in the **Protocol** screen. Each set of protocol rules listed in the table are reusable objects to be used in conjunction with ACL rules in the Access Control screen. For a comprehensive list of port numbers and services, visit the IANA (Internet Assigned Number Authority) website. Click **Security** > **Firewall** > **Protocol** to display the following screen.

Note: Removing a protocol rule will also remove associated ACL rules.

Figure 131 Security > Firewall > Protocol

The following table describes the labels in this screen.

| LABEL                     | DESCRIPTION                                       |
|---------------------------|---|
| Add New Protocol<br>Entry | Click this to configure a customized service.     |
| Name                      | This is the name of your customized service.      |
| Description               | This is a description of your customized service. |

Table 77 Security > Firewall > Protocol

| Table 77 | Security                                | > Firewall > Proto | col (continued) |

| LABEL                 | DESCRIPTION  |
|-----------------------|--|
| Ports/Protocol Number | This shows the port number or range and the IP protocol ( <b>TCP</b> or <b>UDP</b> ) that defines your customized service. |
| Modify                | Click this to edit a customized service.   |

## 15.4.1 Add Customized Service

Add a customized rule or edit an existing rule by specifying the protocol and the port numbers. Click **Add New Protocol Entry** in the **Protocol** screen to display the following screen.

Figure 132 Security > Firewall > Protocol: Add New Protocol Entry

|                                  | Add New Protoc                    | ol Entry                            |
|----------------------------------|-----------------------------------|-------------------------------------|
| Add a customized r<br>number(s). | ule or edit an existing rule by s | becifying the protocol and the port |
| Service Name                     |                                   |                                     |
| Description                      |                                   |                                     |
| Protocol                         | Other                             | ✓                                   |
| Protocol Number                  |                                   | (0-255)                             |

The following table describes the labels in this screen.

| LABEL           | DESCRIPTION   |
|-----------------|---|
| Service Name    | Enter a descriptive name for your customized service. Up to 16 printable ASCII characters are allowed except ["], [`], ['], [<], [>], [^], [\$], [], [&], or [;]. |
| Description     | Enter a description for your customized service. Up to 16 printable ASCII characters are allowed except ["], [`], ['], [<], [>], [^], [\$], [], [&], or [;].      |
| Protocol        | Select the protocol (TCP, UDP, ICMP, ICMPv6, or Other) that defines your customized port from the drop down list box.   |
| Protocol Number | Enter a single port number or the range of port numbers $(0 - 255)$ that define your customized service.  |
| ОК              | Click this to save your changes.  |
| Cancel          | Click this to exit this screen without saving.  |

# 15.5 Access Control (Rules)

An Access Control List (ACL) rule is a manually-defined rule that can accept, reject, or drop incoming or outgoing packets from your network. This screen displays a list of the configured incoming or outgoing filtering rules. Note the order in which the rules are listed. Click **Security > Firewall > Access Control** to display the following screen.

Note: The ordering of your rules is very important as rules are applied in turn.

Figure 133 Security > Firewall > Access Control

| Firewall |                 |               |        |         |  |        |                  |
|----------|-----------------|---------------|--------|---------|--|--------|------------------|
| Genero   | n Protocol      | Access Contro | Dos    |         |  |        |                  |
|          |                 |               |        |         | ept, reject, or drop i<br>r outgoing filtering r |        | bing packets     |
| Rules S  | torage Space Us | sage 0%       |        |         |  |        |                  |
|          |                 |               |        |         |  | +      | Add New ACL Rule |
| #        | Status          | Name          | Src IP | Dest IP | Service  | Action | Modify           |

The following table describes the labels in this screen.

| LABEL                        | DESCRIPTION  |
|------------------------------|--|
| Rules Storage Space<br>Usage | This read-only bar shows how much of the Zyxel Device's memory is in use for recording firewall rules. When you are using 80% or less of the storage space, the bar is green. When the amount of space used is over 80%, the bar is red.   |
| Add New ACL Rule             | Select an index number and click <b>Add New ACL Rule</b> to add a new firewall rule after the selected index number. For example, if you select "6", your new rule becomes number 7 and the previous rule 7 (if there is one) becomes rule 8.                                    |
| #                            | This field displays the rule index number. The ordering of your rules is important as rules are applied in turn.   |
| Name                         | This field displays the rule name.   |
| Src IP                       | This field displays the source IP addresses to which this rule applies.  |
| Dest IP                      | This field displays the destination IP addresses to which this rule applies.   |
| Service                      | This field displays the protocol (All, TCP, UDP, TCP/UDP, ICMP, ICMPv6, or any) used to transport the packets for which you want to apply the rule.  |
| Action                       | Displays whether the firewall silently discards packets ( <b>Drop</b> ), discards packets and sends<br>a TCP reset packet or an ICMP destination-unreachable message to the sender ( <b>Reject</b> ),<br>or allow the passage of ( <b>Accept</b> ) packets that match this rule. |
| Modify                       | Click the Edit icon to edit the firewall rule.   |
|                              | Click the <b>Delete</b> icon to delete an existing firewall rule.  |

Table 79 Security > Firewall > Access Control

## 15.5.1 Add New ACL Rule

Click **Add new ACL** rule or the **Edit** icon next to an existing ACL rule in the **Access Control** screen. The following screen displays. Use this screen to accept, reject, or drop packets based on specified parameters, such as source and destination IP address, IP Type, service, and direction. You can also specify a limit as to how many packets this rule applies to at a certain period of time or specify a schedule for this rule.

| Add New ACL Rule             |                |        |          |         |                 |  |

## 15.6 DoS

DoS (Denial of Service) attacks can flood your Internet connection with invalid packets and connection requests, using so much bandwidth and so many resources that Internet access becomes unavailable. Use the **DoS** screen to activate protection against DoS attacks.

Click Security > Firewall > DoS to display the following screen.

Figure 135 Security > Firewall > DoS

The following table describes the labels in this screen.

# 15.7 Firewall Technical Reference

This section provides some technical background information about the topics covered in this chapter.

## 15.7.1 Firewall Rules Overview

Your customized rules take precedence and override the Zyxel Device's default settings. The Zyxel Device checks the source IP address, destination IP address and IP protocol type of network traffic against the firewall rules (in the order you list them). When the traffic matches a rule, the Zyxel Device takes the action specified in the rule.

Firewall rules are grouped based on the direction of travel of packets to which they apply:

- LAN to Router
   WAN to LAN
- LAN to WAN
   WAN to Router

By default, the Zyxel Device's stateful packet inspection allows packets traveling in the following directions:

• LAN to Router

These rules specify which computers on the LAN can manage the Zyxel Device (remote management).

Note: You can also configure the remote management settings to allow only a specific computer to manage the Zyxel Device.

• LAN to WAN

These rules specify which computers on the LAN can access which computers or services on the WAN.

By default, the Zyxel Device's stateful packet inspection drops packets traveling in the following directions:

• WAN to LAN

These rules specify which computers on the WAN can access which computers or services on the LAN.

Note: You also need to configure NAT port forwarding (or full featured NAT address mapping rules) to allow computers on the WAN to access devices on the LAN.

• WAN to Router

By default the Zyxel Device stops computers on the WAN from managing the Zyxel Device. You could configure one of these rules to allow a WAN computer to manage the Zyxel Device.

Note: You also need to configure the remote management settings to allow a WAN computer to manage the Zyxel Device.

You may define additional rules and sets or modify existing ones but please exercise extreme caution in doing so.

For example, you may create rules to:

- Block certain types of traffic, such as IRC (Internet Relay Chat), from the LAN to the Internet.
- Allow certain types of traffic, such as Lotus Notes database synchronization, from specific hosts on the Internet to specific hosts on the LAN.
- Allow everyone except your competitors to access a web server.
- Restrict use of certain protocols, such as Telnet, to authorized users on the LAN.

These custom rules work by comparing the source IP address, destination IP address and IP protocol type of network traffic to rules set by the administrator. Your customized rules take precedence and override the Zyxel Device's default rules.

## 15.7.2 Guidelines For Security Enhancement With Your Firewall

- 1 Change the default password through the Web Configurator.
- 2 Think about access control before you connect to the network in any way.
- 3 Limit who can access your router.
- 4 Don't enable any local service (such as telnet or FTP) that you do not use. Any enabled service could present a potential security risk. A determined hacker might be able to find creative ways to misuse the enabled services to access the firewall or the network.
- 5 For local services that are enabled, protect against misuse. Protect by configuring the services to communicate only with specific peers, and protect by configuring rules to block packets for the services at specific interfaces.
- 6 Protect against IP spoofing by making sure the firewall is active.
- 7 Keep the firewall in a secured (locked) room.

### **15.7.3 Security Considerations**

Note: Incorrectly configuring the firewall may block valid access or introduce security risks to the Zyxel Device and your protected network. Use caution when creating or deleting firewall rules and test your rules after you configure them.

Consider these security ramifications before creating a rule:

- 1 Does this rule stop LAN users from accessing critical resources on the Internet? For example, if IRC (Internet Relay Chat) is blocked, are there users that require this service?
- 2 Is it possible to modify the rule to be more specific? For example, if IRC is blocked for all users, will a rule that blocks just certain users be more effective?
- 3 Does a rule that allows Internet users access to resources on the LAN create a security vulnerability? For example, if FTP ports (TCP 20, 21) are allowed from the Internet to the LAN, Internet users may be able to connect to computers with running FTP servers.
- 4 Does this rule conflict with any existing rules?

Once these questions have been answered, adding rules is simply a matter of entering the information into the correct fields in the Web Configurator screens.

# CHAPTER 16 MAC Filter

# 16.1 MAC Filter Overview

You can configure the Zyxel Device to permit access to clients based on their MAC addresses in the **MAC Filter** screen. This applies to wired connections. Every Ethernet device has a unique MAC (Media Access Control) address. The MAC address is assigned at the factory and consists of six pairs of hexadecimal characters, for example, 00:A0:C5:00:00:02. You need to know the MAC addresses of wired LAN client to configure this screen.

# 16.2 MAC Filter

Enable **MAC Address Filter** and add the host name and MAC address of a wired LAN client to the table if you wish to allow or deny them access to your network. You can choose to enable or disable the filters per entry; make sure that the check box under **Active** is selected if you want to use a filter. Select **Security** > **MAC Filter**. The screen appears as shown.

Figure 136 Security > MAC Filter

# CHAPTER 17 Parental Control

# 17.1 Parental Control Overview

Parental control allows you to limit the time a user can access the Internet and prevent users from viewing inappropriate content or participating in specified online activities.

# 17.2 Parental Control Schedule and URL Filter

Use this screen to enable parental control and view parental control rules and schedules. You can limit the time a user can access the Internet and prevent users from viewing inappropriate content or participating in specified online activities. These rules are defined in a Parental Control Profile (PCP).

Click Security > Parental Control to open the following screen.

Figure 138 Security > Parental Control

|----------|------------|--------------------|-----------------|---------------|
|----------|------------|--------------------|-----------------|---------------|

# CHAPTER 18 Certificates

# 18.1 Certificates Overview

The Zyxel Device can use certificates (also called digital IDs) to authenticate users. Certificates are based on public-private key pairs. A certificate contains the certificate owner's identity and public key. Certificates provide a way to exchange public keys for use in authentication.

## 18.1.1 What You Can Do in this Chapter

- Use the Local Certificates screen to view and import the Zyxel Device's CA-signed (Certification Authority) certificates (Section 18.3 on page 230).
- Use the Trusted CA screen to save the certificates of trusted CAs to the Zyxel Device. You can also export the certificates to a computer (Section 18.4 on page 234).

# 18.2 What You Need to Know

The following terms and concepts may help as you read through this chapter.

### **Certification Authority**

A Certification Authority (CA) issues certificates and guarantees the identity of each certificate owner. There are commercial certification authorities like CyberTrust or VeriSign and government certification authorities. The certification authority uses its private key to sign certificates. Anyone can then use the certification authority's public key to verify the certificates. You can use the Zyxel Device to generate certification requests that contain identifying information and public keys and then send the certification requests to a certification authority.

# 18.3 Local Certificates

Use this screen to view the Zyxel Device's summary list of certificates, generate certification requests, and import signed certificates. You can import the following certificates to your Zyxel Device:

- Web Server This certificate secures HTTP connections.
- SSH This certificate secures remote connections.

Click Security > Certificates to open the Local Certificates screen.

230

| Current File                               | This field displays the name used to identify this certificate. It is recommended that you give each certificate a unique name.  |  |  |  |  |
| Subject                                    | This field displays identifying information about the certificate's owner, such as <b>CN</b> (Common Name), <b>OU</b> (Organizational Unit or department), <b>O</b> (Organization or company) and <b>C</b> (Country). It is recommended that each certificate have a unique subject information. |  |  |  |  |
| Issuer                                     | This field displays identifying information about the certificate's issuing certification authority, such as a common name, organizational unit or department, organization or company and country.  |  |  |  |  |
| Valid From                                 | This field displays the date that the certificate becomes applicable. The text displays in red and includes a <b>Not Yet Valid!</b> message if the certificate has not yet become applicable.  |  |  |  |  |
| Valid To                                   | This field displays the date that the certificate expires. The text displays in red and includes an <b>Expiring!</b> or <b>Expired!</b> message if the certificate is about to expire or has already expired.  |  |  |  |  |
| Modify                                     | Click the <b>View</b> icon to open a screen with an in-depth list of information about the certificate.  |  |  |  |  |
|  | For a certification request, click Load Signed to import the signed certificate.   |  |  |  |  |
|  | Click the <b>Remove</b> icon to remove the certificate (or certification request). A window displays asking you to confirm that you want to delete the certificate. Note that subsequent certificates move up by one when you take this action.  |  |  |  |  |

 Table 88
 Security > Certificates > Local Certificates

## 18.3.1 Create Certificate Request

Click Security > Certificates > Local Certificates and then Create Certificate Request to open the following screen. Use this screen to have the Zyxel Device generate a certification request. To create a certificate signing request, you need to enter a common name, organization name, state or province name, and the default US two-letter country code (The US country code is by default and not changeable when sold in the U.S.) for the certificate.

| Zyxel Device generate a certific     | ation request. To create a cer                       | tificate signing request, you need |
|--------------------------------------|--|------------------------------------|
| organization name, state/provir      | nce name, and the two-letter o                       | country code for the certificate.  |
|                                      |  |                                    |
| <ul> <li>Auto O Customize</li> </ul> |  |                                    |
|                                      |  |                                    |
|                                      |  |                                    |
| AD (Andorra)                         |  |                                    |
|                                      | Organization name, state/provin     Auto O Customize |                                    |

The following table describes the labels in this screen.

| LABEL                  | DESCRIPTION   |
|------------------------|---|
| Certificate<br>Name    | Enter up to 63 ASCII characters (not including spaces) to identify this certificate.  |
| Common Name            | Select <b>Auto</b> to have the Zyxel Device configure this field automatically. Or select <b>Customize</b> to enter it manually.  |
|                        | Enter the IP address (in dotted decimal notation), domain name or email address in the field provided. The domain name or email address can be up to 63 ASCII characters. The domain name or email address is for identification purposes only and can be any string. |
| Organization<br>Name   | Enter up to 63 characters to identify the company or group to which the certificate owner belongs. You may use any character, including spaces, but the Zyxel Device drops trailing spaces.   |
| State/Province<br>Name | Enter up to 32 characters to identify the state or province where the certificate owner is located.<br>You may use any character, including spaces, but the Zyxel Device drops trailing spaces.   |
| Country/Region<br>Name | Select a country to identify the nation where the certificate owner is located.   |

## 18.3.2 View Certificate Request

Use this screen to view in-depth information about the certificate request. The **Certificate** is used to verify the authenticity of the certification authority. The **Private Key** serves as your digital signature for

authentication and must be safely stored. The **Signing Request** contains the certificate signing request value that you will copy upon submitting the certificate request to the CA (certificate authority).

Click the View icon in the Local Certificates screen to open the following screen.

| LABEL           | DESCRIPTION  |
|-----------------|--|
| Certificate     | This read-only text box displays the certificate in Privacy Enhanced Mail (PEM) format. PEM uses base 64 to convert the binary certificate into a printable form.  |
|                 | You can copy and paste the certificate into an email to send to friends or colleagues or you can copy and paste the certificate into a text editor and save the file on a management computer for later distribution.  |
| Private Key     | This field displays the private key of this certificate.   |
| Signing Request | This field displays the CSR (Certificate Signing Request) information of this certificate. The CSR will be provided to a certificate authority, and it includes information about the public key, organization name, domain name, location, and country of this certificate. |
| Back            | Click <b>Back</b> to return to the previous screen.  |

Table 90 Security > Certificates > Local Certificates: View Certificates (continued)

## 18.4 Trusted CA

Click **Security** > **Certificates** > **Trusted CA** to open the following screen. This screen displays a summary list of certificates of the certification authorities that you have set the Zyxel Device to accept as trusted. The Zyxel Device accepts any valid certificate signed by a certification authority on this list as being trustworthy, which means you do not need to import any certificate that is signed by one of these certification authorities.

Note: A maximum of ten certificates can be added.

|                   |                | Certificates  |      |                      |

# 18.5 Import Trusted CA Certificate

Click **Import Certificate** in the **Trusted CA** screen to open the **Import Certificate** screen. The Zyxel Device trusts any valid certificate signed by any of the imported trusted CA certificates. Certificates should be in one of the following formats: Binary X.509, PEM (base-64) encoded, Binary PKCS#7, or PEM (base-64) encoded PKCS#7.

Note: You must remove any spaces from the certificate's filename before you can import the certificate.

| one of the following | ts any valid certificate signed by any of the import<br>formats: Binary X.509, PEM (base-64) encoded, Bina<br>ed certification authority's certificate to the Zyxel D |                               |

# 18.7 Certificates Technical Reference

This section provides some technical background information about the topics covered in this chapter.

#### **Certification Authorities**

A Certification Authority (CA) issues certificates and guarantees the identity of each certificate owner. There are commercial certification authorities like CyberTrust or VeriSign and government certification authorities.

#### **Public and Private Keys**

When using public-key cryptology for authentication, each host has two keys. One key is public and can be made openly available; the other key is private and must be kept secure. Public-key encryption in general works as follows.

- 1 Tim wants to send a private message to Jenny. Tim generates a public-private key pair. What is encrypted with one key can only be decrypted using the other.
- 2 Tim keeps the private key and makes the public key openly available.
- 3 Tim uses his private key to encrypt the message and sends it to Jenny.
- 4 Jenny receives the message and uses Tim's public key to decrypt it.
- 5 Additionally, Jenny uses her own private key to encrypt a message and Tim uses Jenny's public key to decrypt the message.

The Zyxel Device uses certificates based on public-key cryptology to authenticate users attempting to establish a connection. The method used to secure the data that you send through an established connection depends on the type of connection. For example, a VPN tunnel might use the triple DES encryption algorithm.

The certification authority uses its private key to sign certificates. Anyone can then use the certification authority's public key to verify the certificates.

#### **Advantages of Certificates**

Certificates offer the following benefits.

- The Zyxel Device only has to store the certificates of the certification authorities that you decide to trust, no matter how many devices you need to authenticate.
- Key distribution is simple and very secure since you can freely distribute public keys and you never need to transmit private keys.

#### Certificate File Format

The certification authority certificate that you want to import has to be in PEM (Base-64) encoded X.509 file format. This Privacy Enhanced Mail format uses 64 ASCII characters to convert a binary X.509 certificate into a printable form.

### 18.7.1 Verify a Certificate

Before you import a trusted CA or trusted remote host certificate into the Zyxel Device, you should verify that you have the actual certificate. This is especially true of trusted CA certificates since the Zyxel Device also trusts any valid certificate signed by any of the imported trusted CA certificates.

You can use a certificate's fingerprint to verify it. A certificate's fingerprint is a message digest calculated using the MD5 or SHA1 algorithms. The following procedure describes how to check a certificate's fingerprint to verify that you have the actual certificate.

- 1 Browse to where you have the certificate saved on your computer.
- 2 Make sure that the certificate has a ".cer" or ".crt" file name extension.

Figure 149 Certificates on Your Computer

| Elondon-Office.cer |
|--------------------|
|                    |
|                    |

3 Double-click the certificate's icon to open the **Certificate** window. Click the **Details** tab and scroll down to the **Thumbprint Algorithm** and **Thumbprint** fields.

| Seneral Details Certification   | Path  |
|---|---|
| Show: <a>All&gt;</a>  | <u> </u>  |
| Field Subject Public key Subject Alternative Name Basic Constraints Thumbprint algorithm Thumbprint | Value Glenn RSA (1024 Bits) Digital Signature , Certificate Signing( DNS Name=Glenn Subject Type=CA, Path Length Cons sha1 B0A7 22B6 7960 FF92 52F4 6B4C A2 |
|   | Edit Properties   |

Use a secure method to verify that the certificate owner has the same information in the **Thumbprint Algorithm** and **Thumbprint** fields. The secure method may vary based on your situation. Possible examples would be over the telephone or through an HTTPS connection.

238

# Chapter 19 Voice

# 19.1 Voice Overview

You can make calls over the Internet using VoIP technology. For this, you first need to set up a SIP account with a SIP service provider.

Use this chapter to:

- Connect an analog phone to the Zyxel Device.
- Configure settings such as speed dial.
- Configure network settings to optimize the voice quality of your phone calls.

5G only supports all-IP based packet-switched telephony services. When Voice service is enabled, the Zyxel Device supports Circuit Switched FallBack (CSFB) to deliver or receive circuit-switched voice calls and text messages through a 3G mobile network and then goes back to the 5G network to transmit data packets.

With the voice service, users do not need a SIP account and SIP server to make phone calls over the Internet.

## 19.1.1 What You Can Do in this Chapter

These screens allow you to configure your Zyxel Device to make phone calls over the Internet and your regular phone line, and to set up the phone you connect to the Zyxel Device.

- Use the Voice Mode screen to enable VoIP or VoLTE services on the Zyxel Device (Section 19.2 on page 240).
- Use the SIP Account screen to set up information about your SIP account, control which SIP accounts the phones connected to the Zyxel Device use, and configure audio settings such as volume levels for the phones connected to the Zyxel Device (Section 19.4 on page 241).
- Use the SIP Service Provider screen to configure the SIP server information, and the numbers for certain phone functions (Section 19.5 on page 244).
- Use the **Phone** screens to change settings that depend on which region of the world the Zyxel Device is in (Section 19.6 on page 249).
- Use the **Call Rule** screen to set up shortcuts for dialing frequently-used (VoIP) phone numbers (Section 19.8 on page 251).
- Use the Call History screen to view a call history list (Section 19.9 on page 252).

## 19.2 Voice Mode

Use this screen to enable VoIP or VoLTE services on the Zyxel Device. To access this screen, click **Voice** > **Voice Mode**.

#### Figure 151 Voice > Voice Mode

| Voice Mode                     |                             |  |  |

| Apply         | Click Apply to save the settings.                            |
| Cancel        | Click Cancel to start configuring this screen again.         |

## 19.2.1 What You Need to Know About VolP

#### VolP

VoIP stands for Voice over IP. IP is the Internet Protocol, which is the message-carrying standard the Internet runs on. So, Voice over IP is the sending of voice signals (speech) over the Internet (or another network that uses the Internet Protocol).

#### SIP

SIP stands for Session Initiation Protocol. SIP is a signaling standard that lets one network device (like a computer or the Zyxel Device) send messages to another. In VoIP, these messages are about phone calls over the network. For example, when you dial a number on your Zyxel Device, it sends a SIP message over the network asking the other device (the number you dialed) to take part in the call. To access this screen, click **VoiceVoIP** > **SIP**.

#### **SIP Accounts**

A SIP account is a type of VoIP account. It is an arrangement with a service provider that lets you make phone calls over the Internet. When you set the Zyxel Device to use your SIP account to make calls, the Zyxel Device is able to send all the information about the phone call to your service provider on the Internet. Strictly speaking, you do not need a SIP account. It is possible for one SIP device (like the Zyxel Device) to call another without involving a SIP service provider. However, the networking difficulties involved in doing this make it tremendously impractical under normal circumstances. Your SIP account provider removes these difficulties by taking care of the call routing and setup – figuring out how to get your call to the right place in a way that you and the other person can talk to one another.

#### **SIP Address**

A SIP address is a URI (Uniform Resource Identifier) that resembles an email address, using the format: user@domain. It uniquely identifies a telephone extension over a VoIP system. A SIP address of 123-45-67@voip-provider.net tells a client to connect to voip-provider.net and request a connection to 123-45-67. While VoIP can only send voice messages over the Internet, SIP (though strictly speaking is a type of VoIP) can send voice, data, video, and other media. VoIP phones also need to be connected to a computer to function, whereas SIP phones only need to be connected to a modem.

## 19.3 Before You Begin

- Before you can use these screens, you need to have a VoIP account already set up. If you do not have one yet, you can sign up with a VoIP service provider over the Internet.
- You should have the information your VoIP service provider gave you ready, before you start to configure the Zyxel Device.

## 19.4 SIP Account

You can make calls over the Internet using VoIP technology. For this, you first need to set up a SIP account with a SIP service provider. The Zyxel Device uses a SIP account to make outgoing VoIP calls, and to check if an incoming call's destination number matches your SIP account's VoIP number. In order to make and receive VoIP calls, you need to enable and configure a SIP account, and then map it to a phone port. The SIP account contains information that allows your Zyxel Device to connect to your VoIP service provider.

To access this screen, click Voice > SIP > SIP Account.

#### Figure 152 Voice > SIP > SIP Account

|        |                        |                     | SIP                                  |                                       |               |

| LABEL                                       | DESCRIPTION  |
|---|--|
| Password                                    | Enter the password for registering this SIP account, exactly as it was given to you.<br>You can use up to 95 printable ASCII characters.                           |
| URL Type                                    |  |
| URL Type                                    | Select whether or not to include the SIP service domain name when the Zyxel Device sends the SIP number.   |
|   | SIP – include the SIP service domain name.   |
|   | TEL – do not include the SIP service domain name.  |
| Voice Features                              |  |
| Primary/Secondary/Third<br>Compression Type | Select the type of voice coder or decoder (codec) that you want the Zyxel Device to use.   |
|   | G.711 provides higher voice quality but requires more bandwidth (64 kbps).   |
|   | • <b>G.729</b> provides good sound quality and reduces the required bandwidth to 8 kbps.   |
|   | • G.711a is typically used in Europe.  |
|   | • G.711u is typically used in North America and Japan.   |
|   | • G.726-32 operates at 16, 24, 32 or 40 kbps.  |
|   | • G.722 operates at 6.3 kbps or 5.3 kbps.  |
|   | When two SIP devices start a SIP session, they must agree on a codec.  |
|   | Select the Zyxel Device's first choice for voice coder or decoder.   |
|   | Select the Zyxel Device's second choice for voice coder or decoder. Select <b>None</b> if you only want the Zyxel Device to accept the first choice.               |
|   | Select the Zyxel Device's third choice for voice coder or decoder. Select <b>None</b> if you only want the Zyxel Device to accept the first or second choice.      |
| Speaking Volume Control                     | Select the loudness that the Zyxel Device uses for speech that it sends to the peer device. Choices are <b>Minimum</b> , <b>Middle</b> , and <b>Maximum</b> .      |
| Listening Volume Control                    | Select the loudness that the Zyxel Device uses for speech that it receives from the peer device. Choices are <b>Minimum</b> , <b>Middle</b> , and <b>Maximum</b> . |
| Enable G. 168 (Echo<br>Cancellation)        | Select this if you want to eliminate the echo caused by the sound of your voice reverberating in the telephone receiver while you talk.                            |
| Enable VAD (Voice Active<br>Detector)       | Select this if the Zyxel Device should stop transmitting when you are not speaking.<br>This reduces the bandwidth the Zyxel Device uses.                           |
| Call Features                               |  |
| Send Caller ID                              | Select this if you want to send identification when you make VoIP phone calls. Clear this if you do not want to send identification.                               |
| OK  | Click this to save your changes.   |

# 19.5 SIP Service Provider

Use this screen to view the SIP service provider information on the Zyxel Device. A SIP provider offers Internet call services using VoIP technology. You may need to consult your SIP service provider for the following settings.

To access this screen, click **Voice** > **SIP** > **SIP** Service Provider.

#### Figure 154 Voice > SIP > SIP Service Provider

| REGISTER Server Address   | This shows the IP address or domain name of the SIP register server.  |
| SIP Service Domain        | Enter the SIP service domain name. In the full SIP URI, this is the part after the<br>@symbol. You can use up to 127 printable ASCII Extended set characters. |
| Modify                    | Click the <b>Modify</b> icon to configure the profile of SIP service provider settings.   |

## 19.5.1 Provider Entry Edit

Use this screen to configure the SIP server information, the numbers for certain phone functions and dialing plan for a SIP service provider.

Click the **Modify** icon next to a profile of SIP service provider settings in the **Voice** > **SIP** > **SIP** Service **Provider** to open the following screen.

| Flaure 155 | voice > | 31P > | SIP Service | Provider: | EQII |

The following table describes the labels in this screen.

Table 98 Voice > SIP > SIP Service Provider > Add New Provider or Edit

| LABEL                     | DESCRIPTION   |
|---------------------------|---|
| General                   |   |
| SIP Service Provider      | Select this if you want the Zyxel Device to use this SIP provider. Clear it if you do not want the Zyxel Device to use this SIP provider.   |
| SIP Service Provider Name | Enter the name of your SIP service provider.  |
| SIP Local Port            | Enter the Zyxel Device's listening port number, if your VoIP service provider gave you one. Otherwise, keep the default value.  |
| SIP Proxy Server Address  | Enter the IP address or domain name of the SIP server provided by your VoIP service provider. You can use up to 95 printable ASCII characters. It does not matter whether the SIP server is a proxy, redirect or register server. |

| LABEL  | DESCRIPTION   |
|--|---|
| SIP Proxy Server Port                                    | Enter the SIP server's listening port number, if your VoIP service provider gave you one. Otherwise, keep the default value.  |
| SIP REGISTRAR Server<br>Address                          | Enter the IP address or domain name of the SIP register server, if your VoIP service provider gave you one. Otherwise, enter the same address you entered in the SIP Server Address field. You can use up to 95 printable ASCII characters.   |
| SIP REGISTRAR Server Port                                | Enter the SIP register server's listening port number, if your VoIP service provider gave you one. Otherwise, enter the same port number you entered in the SIP Server Port field.  |
| SIP Service Domain                                       | Enter the SIP service domain name. In the full SIP URI, this is the part after the @ symbol. You can use up to 127 printable ASCII Extended set characters.   |
| RFC Support  |   |
| PRACK (RFC 3262)   | RFC 3262 defines a mechanism to provide reliable transmission of SIP provisional response messages, which convey information on the processing progress of the request. This uses the option tag 100rel and the Provisional Response ACKnowledgement (PRACK) method.  |
|  | Select <b>Supported</b> or <b>Required</b> to have the Zyxel Device include a SIP Require or<br>Supported header field with the option tag 100rel in all INVITE requests. When the<br>Zyxel Device receives a SIP response message indicating that the phone it called is<br>ringing, the Zyxel Device sends a PRACK message to have both sides confirm the<br>message is received.   |
|  | If you select <b>Supported</b> , the peer device supports the option tag 100rel to send provisional responses reliably.   |
|  | If you select <b>Required</b> , the peer device requires the option tag 100rel to send provisional responses reliably.  |
|  | Select <b>Disabled</b> to turn off this function.   |
| VoIP IOP Flags – Select VoIP inter-operability settings. |   |
| Replace dial digit '#' to<br>'%23' in SIP messages       | Replace a dial digit "#" with "%23" in the INVITE messages.   |
| Remove the 'Route' header<br>in SIP messages             | Remove the 'Route' header in SIP packets.   |
| Bound Interface Name                                     |   |
| Bound Interface Name                                     | If you select <b>AnyWAN</b> , the Zyxel Device automatically activates the VolP service when any WAN connection is up.  |
|  | If you select <b>MultiWAN</b> , you also need to select the pre-configured WAN connections. The VoIP service is activated only when one of the selected WAN connections is up.  |
| Outbound Proxy   |   |
| Outbound Proxy Address                                   | Enter the IP address or domain name of the SIP outbound proxy server if your VoIP service provider has a SIP outbound server to handle voice calls. This allows the Zyxel Device to work with any type of NAT router and eliminates the need for STUN or a SIP ALG. Turn off any SIP ALG on a NAT router in front of the Zyxel Device to keep it from re-translating the IP address (since this is already handled by the outbound proxy server). |
| Outbound Proxy Port                                      | Enter the SIP outbound proxy server's listening port, if your VoIP service provider gave you one. Otherwise, keep the default value.  |
| Use DHCP Option 120 first                                | Select this to have the Zyxel Device use DHCP Option 120 first.   |
| RTP Port Range   |   |

| Table 98 | Voice > SIP > SIP Service Provider > | > Add New Provider or Edit (continued) |
|----------|--------------------------------------|--|
|          |                                      |  |

| LABEL                               | DESCRIPTION  |
|-------------------------------------|--|
| Start/End Port                      | Enter the listening port numbers for RTP traffic, if your VoIP service provider gave you this information. Otherwise, keep the default values.   |
|                                     | To enter one port number, enter the port number in the Start Port and End Port fields.   |
|                                     | To enter a range of ports,   |
|                                     | <ul> <li>enter the port number at the beginning of the range in the Start Port field.</li> <li>enter the port number at the end of the range in the End Port field.</li> </ul>   |
| DTMF Mode                           | Control how the Zyxel Device handles the tones that your telephone makes when you push its buttons. You should use the same mode your VoIP service provider uses.  |
|                                     | RFC2833 – send the DTMF tones in RTP packets.  |
|                                     | <b>Inband</b> – send the DTMF tones in the voice data stream. This method works best when you are using a codec that does not use compression (like G.711). Codecs that use compression (like G.726) can distort the tones.  |
|                                     | SIP Info – send the DTMF tones in SIP messages.  |
| Transport Type                      |  |
| Transport Type                      | Select the transport layer protocol <b>UDP</b> or <b>TCP</b> (usually UDP) used for SIP.   |
| Ignore Direct IP                    | Select <b>Enable</b> to have the connected devices accept SIP requests only from the SIP proxy/register server specified above. SIP requests sent from other IP addresses will be ignored.   |
| FAX Option                          | This field controls how the Zyxel Device handles fax messages.   |
| QoS Tag                             |  |
| SIP DSCP Mark Setting               | Enter the DSCP (DiffServ Code Point) number for SIP message transmissions. The Zyxel Device creates Class of Service (CoS) priority tags with this number to SIP traffic that it transmits.  |
| RTP DSCP Mark Setting               | Enter the DSCP (DiffServ Code Point) number for RTP voice transmissions. The Zyxel Device creates Class of Service (CoS) priority tags with this number to RTP traffic that it transmits.  |
| Timer Setting                       |  |
| SIP Register Expiration<br>Duration | Enter the number of seconds your SIP account is registered with the SIP register server before it is deleted. The Zyxel Device automatically tries to re-register your SIP account when one-half of this time has passed (The SIP register server might have a different expiration).  |
| SIP Register Fall Re-try timer      | Enter the number of seconds the Zyxel Device waits before it tries again to register the SIP account, if the first try failed or if there is no response.  |
| Session Expires [SE]                | Enter the number of seconds the Zyxel Device lets a SIP session remain idle (without traffic) before it automatically disconnects the session.   |
| Min-SE                              | Enter the minimum number of seconds the Zyxel Device lets a SIP session remain idle<br>(without traffic) before it automatically disconnects the session. When two SIP<br>devices start a SIP session, they must agree on an expiration time for idle sessions. This<br>field is the shortest expiration time that the Zyxel Device accepts. |
| Dialing Interval Selection          |  |
| Dialing Interval Selection          | Enter the number of seconds the Zyxel Device should wait after you stop dialing numbers before it makes the phone call. The value depends on how quickly you dial phone numbers.   |
| Enable DNS SRV                      | Select this to have the Zyxel Device query your ISP's DNS server for a list of any available SIP servers that it maintains. This is useful if your static SIP server experiences difficulties, making it hard for your IP phone users to make SIP calls.   |
| ОК                                  | Click this to save your changes.   |
| Cancel                              | Click this to exit this screen without saving.   |

NR/FWA Indoor Series User's Guide

# 19.6 Phone

Use these screens to configure SIP numbers and regions for IP phones that are connected to the Zyxel Device.

## 19.6.1 Phone Device

Use this screen to view detailed information on phones used for Internet phone calls (SIP). You can define which phones will ring when a specific SIP address receives an incoming call, and which SIP address will be used when an outgoing call is made with a specific phone.

To access this screen, click **Voice** > **Phone** > **Phone Device**.

| Figure 156 Voice > Phone > Phone Device |
|---|
|---|

| Analog | p Phone  |                     |                     |        |
|--------|----------|---------------------|---------------------|--------|
|        |          |                     | Outgoing SIP Number | Modify |
| #      | Phone ID | Incoming SIP Number | oorgoing on Homber  |        |

Each field is described in the following table.

| LABEL                  | DESCRIPTION   |
|------------------------|---|
| #                      | This displays the index number of the phone device.                                   |
| Phone ID               | This field displays the name of a phone port on the Zyxel Device.                     |
| Incoming SIP<br>Number | This field displays the SIP address that you use to receive calls on this phone port. |
| Outgoing SIP<br>Number | This field displays the SIP address that you use to make calls on this phone port.    |
| Modify                 | Click the <b>Edit</b> icon to configure the SIP account.                              |

Table 99 Voice > Phone > Phone Device

## 19.6.2 Phone Device Edit

Use this screen to control which SIP account and PSTN line each phone uses. Click an **Edit** icon in **Voice** > **Phone** > **Phone Device** to open the following screen.

| 157 Voice > Phone > Phone Device > Ed                | it              |
|--|-----------------|
| Phone  | Device Edit     |
| SIP Account to Make Outgoing Call                    |                 |
| SIP Account  | SIP Number      |
| € SIP1   | ChangeMe        |
| O SIP2   | ChangeMe        |
| SIP Account(s) to Receive Incomming Call SIP Account | directoryNumber |
| SIP1   | ChangeMe        |
| SIP2   | ChangeMe        |
|  |                 |

| 🗹 Immediate Dial Enable                              |                 |
|  |                 |
|  |                 |

Each field is described in the following table.

| Table 100 | Voice > Phone > Phone Device > Edit |  |
|-----------|-------------------------------------|--|

| LABEL   | DESCRIPTION   |
|---|---|
| SIP Account to<br>Make Outgoing<br>Call       | Select the SIP account you want to use when making outgoing calls with the analog phone connected to this phone port.   |
| SIP Account(s) to<br>Receive Incoming<br>Call | Select a SIP account if you want to receive phone calls for the selected SIP account on this phone port.  |
|   | If you select more than one SIP account for incoming calls, there is no way to distinguish between them when you receive phone calls. If you do not select a source for incoming calls, you cannot receive any calls on this phone port.  |
| Immediate Dial<br>Enable                      | Select this if you want to use the pound key (#) to tell the Zyxel Device to make the phone call immediately, instead of waiting for the number of second you selected in the Dialog Interval Selection field of the VoIP > SIP > SIP Service Provider > Add New Provider or Edit screen. |
|   | If you select this, dial the phone number, and then press the pound key. The Zyxel Device makes the call immediately instead of waiting. You can still wait, if you want.   |
| Cancel  | Click Cancel to exit this screen without saving   |
| OK  | Click <b>OK</b> to save your changes.   |

# 19.7 Phone Region

Use this screen to configure settings that depend on which region of the world the Zyxel Device is in. Selecting the region where the device is physically located improves the quality of phone calls.

To access this screen, click **Voice** > **Phone**.

#### Figure 158 Voice > Phone

| Phone  |  |  |

| Selecting current region where this device physically is located provides better quality of phone calls. |  |  |
| Region Setting   | USA - United States of America                         |  |
| Call Service Mode  | Europe Type  |  |
| Note   |  |  |
| Caution : When Region Setting is chang   | ed, you need to reboot device to take settings effect. |  |
|  | Cancel Apply   |  |

The following table describes the labels in this screen.

|  | Table | 101 | Voice > Phone |
|--|-------|-----|---------------|
|--|-------|-----|---------------|

| LABEL             | DESCRIPTION  |
|-------------------|--|
| Region Setting    | Select the place in which the Zyxel Device is located.   |
| Call Service Mode | <ul> <li>Select the mode for supplementary phone services (call hold, call waiting, call transfer and three-way conference calls) that your VoIP service provider supports.</li> <li>Europe Type – use supplementary phone services in European mode.</li> <li>USA Type – use supplementary phone services American mode.</li> </ul> |
|                   | You might have to subscribe to these services to use them. Contact your VoIP service provider.   |
| Apply             | Click this to save your changes and to apply them to the Zyxel Device.   |
| Cancel            | Click this to set every field in this screen to its last-saved value.  |

Note: You need to reboot the Zyxel Device after changing the region settings for it to take effect.

# 19.8 Call Rule

Use this screen to add, edit, or remove speed-dial numbers for outgoing calls. Speed dial provides shortcuts for dialing frequently-used (VoIP) phone numbers. You also have to create speed-dial entries if you want to call SIP numbers that contain letters. Once you have configured a speed dial rule, you can use a shortcut (the speed dial number, #01 for example) on your phone's keypad to call the phone number. To access this screen, click **Voice** > **Call Rule**.

| Figure 159 Vo | ice > Call Rule |
|---------------|-----------------|

| #08   |        |                      |  |  |  |  |
| #09   |        |                      |  |  |  |  |
| #10   |        |                      |  |  |  |  |
|   |        |                      |  |  |  |  |
|   | Cancel | Apply                |  |  |  |  |

The following table describes the labels in this screen.

| Table 102 Voice > Call Rule |   |  |
|-----------------------------|---|--|
| LABEL                       | DESCRIPTION   |  |
| Keys                        | This field displays the speed-dial number you should dial to use this entry.  |  |
| Number                      | Enter the SIP number you want the Zyxel Device to call when you dial the speed-dial number.   |  |
| Description                 | Enter a short description to identify the party you call when you dial the speed-dial number. You can use up to 127 printable ASCII characters. |  |
| Clear All Speed Dials       | Click this button to remove all speed dials saved.  |  |
| Apply                       | Click this to save your changes and to apply them to the Zyxel Device.  |  |
| Cancel                      | Click this to set every field in this screen to its last-saved value.   |  |

#### Table 102 Voice > Call Rule

# 19.9 Call History

The Zyxel Device logs calls from or to your SIP addresses. This screen allows you to view a summary of received, dialed and missed calls and a call history list. You can also view detailed information on each outgoing and incoming call.

## 19.9.1 Call History Screen

To access this screen, click **Voice > Call History**.

#### Figure 160 Voice > Call History

|              |                            |  |                          |                             |                      | <b>&gt;</b>                               |

Each field is described in the following table.

#### Table 103 Voice > Call History

| LABEL                  | DESCRIPTION   |
|------------------------|---|
| Clear                  | Click this button to remove all entries from the call history list.                   |
| Refresh                | Click this button to renew the call history list.                                     |
| Export                 | Click this button to download a call history list.                                    |
| Incoming Calls         | This displays how many calls you received that day.                                   |
| Outgoing Calls         | This displays how many calls originated from you that day.                            |
| Missing Calls          | This displays how many incoming calls were not answered that day.                     |
| Classify               | Select the type of the calls. The call types are: All, Incoming, Outgoing and Missed. |
| Туре                   | This displays the type of the calls.  |
| Date                   | This displays the date and time when the calls were made.                             |
| Name                   | This displays the SIP account you called.   |
| Peer Number            | This displays the SIP address that called you or you called.                          |
| Phone Device           | This displays the name of a phone port on the Zyxel Device.                           |
| Outgoing Number        | This displays the SIP address you used to make outgoing calls or receive calls.       |
| Duration<br>(hh:mm:ss) | This displays how long the call lasted.   |
| Modify                 | Click the <b>Delete</b> icon to remove the call history.                              |
|                        |   |

# 19.10 Technical Reference

This section contains background material relevant to the VoIP screens.

## VolP

VoIP is the sending of voice signals over Internet Protocol. This allows you to make phone calls and send faxes over the Internet at a fraction of the cost of using the traditional circuit-switched telephone network. You can also use servers to run telephone service applications like PBX services and voice mail. Internet Telephony Service Provider (ITSP) companies provide VoIP service.

Circuit-switched telephone networks require 64 kilobits per second (Kbps) in each direction to handle a telephone call. VoIP can use advanced voice coding techniques with compression to reduce the required bandwidth.

## SIP

The Session Initiation Protocol (SIP) is an application-layer control (signaling) protocol that handles the setting up, altering and tearing down of voice and multimedia sessions over the Internet.

SIP signaling is separate from the media for which it handles sessions. The media that is exchanged during the session can use a different path from that of the signaling. SIP handles telephone calls and can interface with traditional circuit-switched telephone networks.

## **SIP Identities**

A SIP account uses an identity (sometimes referred to as a SIP address). A complete SIP identity is called a SIP URI (Uniform Resource Identifier). A SIP account's URI identifies the SIP account in a way similar to the way an email address identifies an email account. The format of a SIP identity is SIP-Number@SIP-Service-Domain.

## **SIP Number**

The SIP number is the part of the SIP URI that comes before the "@" symbol. A SIP number can use letters like in an email address (johndoe@your-ITSP.com for example) or numbers like a telephone number (1122334455@VoIP-provider.com for example).

## **SIP Service Domain**

The SIP service domain of the VoIP service provider is the domain name in a SIP URI. For example, if the SIP address is <u>1122334455@VoIP-provider.com</u>, then "VoIP-provider.com" is the SIP service domain.

## **SIP Registration**

Each Zyxel Device is an individual SIP User Agent (UA). To provide voice service, it has a public IP address for SIP and RTP protocols to communicate with other servers.

A SIP user agent has to register with the SIP registrar and must provide information about the users it represents, as well as its current IP address (for the routing of incoming SIP requests). After successful registration, the SIP server knows that the users (identified by their dedicated SIP URIs) are represented by the UA, and knows the IP address to which the SIP requests and responses should be sent.

Registration is initiated by the User Agent Client (UAC) running in the VoIP gateway (the Zyxel Device). The gateway must be configured with information letting it know where to send the REGISTER message, as well as the relevant user and authorization data.

A SIP registration has a limited lifespan. The User Agent Client must renew its registration within this lifespan. If it does not do so, the registration data will be deleted from the SIP registrar's database and the connection broken.

The Zyxel Device attempts to register all enabled subscriber ports when it is switched on. When you enable a subscriber port that was previously disabled, the Zyxel Device attempts to register the port immediately.

## **Authorization Requirements**

SIP registrations (and subsequent SIP requests) require a username and password for authorization. These credentials are validated through a challenge / response system using the HTTP digest mechanism (as detailed in RFC 3261, "SIP: Session Initiation Protocol").

#### **SIP Servers**

SIP is a client-server protocol. A SIP client is an application program or device that sends SIP requests. A SIP server responds to the SIP requests.

When you use SIP to make a VoIP call, it originates at a client and terminates at a server. A SIP client could be a computer or a SIP phone. One device can act as both a SIP client and a SIP server.

### SIP User Agent

A SIP user agent can make and receive VoIP telephone calls. This means that SIP can be used for peerto-peer communications even though it is a client-server protocol. In the following figure, either **A** or **B** can act as a SIP user agent client to initiate a call. **A** and **B** can also both act as a SIP SIP user agent to receive the call.

#### **SIP Proxy Server**

A SIP proxy server receives requests from clients and forwards them to another server.

In the following example, you want to use client device A to call someone who is using client device C.

- 1 The client device (A in the figure) sends a call invitation to the SIP proxy server (B).
- 2 The SIP proxy server forwards the call invitation to C.

#### **SIP Redirect Server**

A SIP redirect server accepts SIP requests, translates the destination address to an IP address and sends the translated IP address back to the device that sent the request. Then the client device that originally sent the request can send requests to the IP address that it received back from the redirect server. Redirect servers do not initiate SIP requests.

In the following example, you want to use client device A to call someone who is using client device C.

- 1 Client device A sends a call invitation for C to the SIP redirect server (B).
- 2 The SIP redirect server sends the invitation back to A with C's IP address (or domain name).
- 3 Client device A then sends the call invitation to client device C.

#### **SIP Register Server**

A SIP register server maintains a database of SIP identity-to-IP address (or domain name) mapping. The register server checks your user name and password when you register.

#### RTP

When you make a VoIP call using SIP, the RTP (Real time Transport Protocol) is used to handle voice data transfer. See RFC 1889 for details on RTP.

#### **Pulse Code Modulation**

Pulse Code Modulation (PCM) measures analog signal amplitudes at regular time intervals and converts them into bits.

#### **SIP Call Progression**

The following figure displays the basic steps in the setup and tear down of a SIP call. A calls B.

| А         |                            | В          |
|-----------|----------------------------|------------|
| 1. INVITE |                            |            |
|           |                            | 2. Ringing |
|           |                            | 3. OK      |
| 4. ACK    | <b>→</b>                   |            |
|           | 5.Dialogue (voice traffic) |            |
| 6. BYE    |                            |            |
|           |                            | 7. OK      |

Table 104 SIP Call Progression

- **1** A sends a SIP INVITE request to **B**. This message is an invitation for **B** to participate in a SIP telephone call.
- 2 B sends a response indicating that the telephone is ringing.
- **3 B** sends an OK response after the call is answered.
- 4 A then sends an ACK message to acknowledge that B has answered the call.
- 5 Now A and B exchange voice media (talk).
- 6 After talking, A hangs up and sends a BYE request.
- 7 B replies with an OK response confirming receipt of the BYE request and the call is terminated.

## SIP Call Progression Through Proxy Servers

Usually, the SIP UAC sets up a phone call by sending a request to the SIP proxy server. Then, the proxy server looks up the destination to which the call should be forwarded (according to the URI requested by the SIP UAC). The request may be forwarded to more than one proxy server before arriving at its destination.

The response to the request goes to all the proxy servers through which the request passed, in reverse sequence. Once the session is set up, session traffic is sent between the UAs directly, bypassing all the proxy servers in between.

The following figure shows the SIP and session traffic flow between the user agents (UA 1 and UA 2) and the proxy servers (this example shows two proxy servers, PROXY 1 and PROXY 2).

#### Figure 164 SIP Call Through Proxy Servers

The following table shows the SIP call progression.

- 1 User Agent 1 sends a SIP INVITE request to Proxy 1. This message is an invitation to User Agent 2 to participate in a SIP telephone call. Proxy 1 sends a response indicating that it is trying to complete the request.
- 2 Proxy 1 sends a SIP INVITE request to Proxy 2. Proxy 2 sends a response indicating that it is trying to complete the request.
- 3 Proxy 2 sends a SIP INVITE request to User Agent 2.
- 4 User Agent 2 sends a response back to Proxy 2 indicating that the phone is ringing. The response is relayed back to User Agent 1 through Proxy 1.
- 5 User Agent 2 sends an OK response to Proxy 2 after the call is answered. This is also relayed back to User Agent 1 through Proxy 1.
- 6 User Agent 1 and User Agent 2 exchange RTP packets containing voice data directly, without involving the proxies.
- 7 When User Agent 2 hangs up, he sends a BYE request.
- 8 User Agent 1 replies with an OK response confirming receipt of the BYE request, and the call is terminated.

## Voice Coding

A codec (coder/decoder) codes analog voice signals into digital signals and decodes the digital signals back into analog voice signals. The Zyxel Device supports the following codecs.

• G.711 is a Pulse Code Modulation (PCM) waveform codec. PCM measures analog signal amplitudes at regular time intervals and converts them into digital samples. G.711 provides very good sound quality but requires 64 kbps of bandwidth.

- G.726 is an Adaptive Differential PCM (ADPCM) waveform codec that uses a lower bitrate than standard PCM conversion. ADPCM converts analog audio into digital signals based on the difference between each audio sample and a prediction based on previous samples. The more similar the audio sample is to the prediction, the less space needed to describe it. G.726 operates at 16, 24, 32 or 40 kbps.
- G.729 is an Analysis-by-Synthesis (AbS) hybrid waveform codec that uses a filter based on information about how the human vocal tract produces sounds. G.729 provides good sound quality and reduces the required bandwidth to 8 kbps.

### Voice Activity Detection/Silence Suppression

Voice Activity Detection (VAD) detects whether or not speech is present. This lets the Zyxel Device reduce the bandwidth that a call uses by not transmitting "silent packets" when you are not speaking.

### **Comfort Noise Generation**

When using VAD, the Zyxel Device generates comfort noise when the other party is not speaking. The comfort noise lets you know that the line is still connected as total silence could easily be mistaken for a lost connection.

## Echo Cancellation

G.168 is an ITU-T standard for eliminating the echo caused by the sound of your voice reverberating in the telephone receiver while you talk.

## MWI (Message Waiting Indication)

Enable Message Waiting Indication (MWI) enables your phone to give you a message-waiting (beeping) dial tone when you have a voice message(s). Your VoIP service provider must have a messaging system that sends message waiting status SIP packets as defined in RFC 3842.

## Custom Tones (IVR)

IVR (Interactive Voice Response) is a feature that allows you to use your telephone to interact with the Zyxel Device. The Zyxel Device allows you to record custom tones for the **Early Media** and **Music On Hold** functions. The same recordings apply to both the caller ringing and on hold tones.

| LABEL                               | DESCRIPTION   |
|-------------------------------------|---|
| Total Time for All Tones            | 900 seconds for all custom tones combined   |
| Maximum Time per Individual<br>Tone | 180 seconds   |
| Total Number of Tones<br>Recordable | 5<br>You can record up to 5 different custom tones but the total time must be 900<br>seconds or less. |

Table 106 Custom Tones Details

#### **Recording Custom Tones**

Use the following steps if you would like to create new tones or change your tones:

- 1 Pick up the phone and press "\*\*\*\*" on your phone's keypad and wait for the message that says you are in the configuration menu.
- 2 Press a number from 1101~1105 on your phone followed by the "#" key.
- 3 Play your desired music or voice recording into the receiver's mouthpiece. Press the "#" key.
- 4 You can continue to add, listen to, or delete tones, or you can hang up the receiver when you are done.

### Listening to Custom Tones

Do the following to listen to a custom tone:

- 1 Pick up the phone and press "\*\*\*\*" on your phone's keypad and wait for the message that says you are in the configuration menu.
- 2 Press a number from 1201~1208 followed by the "#" key to listen to the tone.
- **3** You can continue to add, listen to, or delete tones, or you can hang up the receiver when you are done.

### **Deleting Custom Tones**

Do the following to delete a custom tone:

- 1 Pick up the phone and press "\*\*\*\*" on your phone's keypad and wait for the message that says you are in the configuration menu.
- 2 Press a number from 1301~1308 followed by the "#" key to delete the tone of your choice. Press 14 followed by the "#" key if you wish to clear all your custom tones.

You can continue to add, listen to, or delete tones, or you can hang up the receiver when you are done.

# 19.10.1 Quality of Service (QoS)

Quality of Service (QoS) refers to both a network's ability to deliver data with minimum delay, and the networking methods used to provide bandwidth for real-time multimedia applications.

# Type of Service (ToS)

Network traffic can be classified by setting the ToS (Type of Service) values at the data source (for example, at the Zyxel Device) so a server can decide the best method of delivery, that is the least cost, fastest route and so on.

#### DiffServ

DiffServ is a class of service (CoS) model that marks packets so that they receive specific per-hop treatment at DiffServ-compliant network devices along the route based on the application types and traffic flow. Packets are marked with DiffServ Code Points (DSCP) indicating the level of service desired.

This allows the intermediary DiffServ-compliant network devices to handle the packets differently depending on the code points without the need to negotiate paths or remember state information for every flow. In addition, applications do not have to request a particular service or give advanced notice of where the traffic is going.<sup>3</sup>

## **DSCP and Per-Hop Behavior**

DiffServ defines a new DS (Differentiated Services) field to replace the Type of Service (TOS) field in the IP header. The DS field contains a 2-bit unused field and a 6-bit DSCP field which can define up to 64 service levels. The following figure illustrates the DS field.

DSCP is backward compatible with the three precedence bits in the ToS octet so that non-DiffServ compliant, ToS-enabled network device will not conflict with the DSCP mapping.

Figure 165 DiffServ: Differentiated Service Field

| DSCP    | Unused  |
|---------|---------|
| (6-bit) | (2-bit) |

The DSCP value determines the forwarding behavior, the PHB (Per-Hop Behavior), that each packet gets across the DiffServ network. Based on the marking rule, different kinds of traffic can be marked for different priorities of forwarding. Resources can then be allocated according to the DSCP values and the configured policies.

# 19.10.2 Phone Services Overview

Supplementary services such as call hold, call waiting, and call transfer. are generally available from your VoIP service provider. The Zyxel Device supports the following services:

- Call Return
- Call Hold
- Call Waiting
- Making a Second Call
- Call Transfer
- Call Forwarding
- Three-Way Conference
- Internal Calls
- Call Park and Pickup
- Do not Disturb
- IVR
- Call Completion
- CCBS
- Outgoing SIP

<sup>3.</sup> The Zyxel Device does not support DiffServ at the time of writing.

Note: To take full advantage of the supplementary phone services available through the Zyxel Device's phone ports, you may need to subscribe to the services from your VoIP service provider.

#### 19.10.2.1 The Flash Key

Flashing means to press the hook for a short period of time (a few hundred milliseconds) before releasing it. On newer telephones, there should be a "flash" key (button) that generates the signal electronically. If the flash key is not available, you can tap (press and immediately release) the hook by hand to achieve the same effect. However, using the flash key is preferred since the timing is much more precise. With manual tapping, if the duration is too long, it may be interpreted as hanging up by the Zyxel Device.

You can invoke all the supplementary services by using the flash key.

### 19.10.2.2 Europe Type Supplementary Phone Services

This section describes how to use supplementary phone services with the **Europe Type Call Service Mode**. Commands for supplementary services are listed in the table below.

After pressing the flash key, if you do not issue the sub-command before the default sub-command timeout (2 seconds) expires or issue an invalid sub-command, the current operation will be aborted.

| COMMAND | SUB-COMMAND | DESCRIPTION   |
|---------|-------------|---|
| Flash   |             | Put a current call on hold to place a second call.  |
|         |             | Switch back to the call (if there is no second call).   |
| Flash   | 0           | Drop the call presently on hold or reject an incoming call which is waiting for answer.                             |
| Flash   | 1           | Disconnect the current phone connection and answer the incoming call or resume with caller presently on hold.       |
| Flash   | 2           | 1. Switch back and forth between two calls.   |
|         |             | 2. Put a current call on hold to answer an incoming call.   |
|         |             | 3. Separate the current three-way conference call into two individual calls (one is on-line, the other is on hold). |
| Flash   | 3           | Create three-way conference connection.   |
| Flash   | *98#        | Transfer the call to another phone.   |

Table 107 European Flash Key Commands

#### **European Call Hold**

Call hold allows you to put a call (A) on hold by pressing the flash key.

If you have another call, press the flash key and then "2" to switch back and forth between caller **A** and **B** by putting either one on hold.

Press the flash key and then "0" to disconnect the call presently on hold and keep the current call on line.

Press the flash key and then "1" to disconnect the current call and resume the call on hold.

If you hang up the phone but a caller is still on hold, there will be a remind ring.

## **European Call Waiting**

This allows you to place a call on hold while you answer another incoming call on the same telephone (directory) number.

If there is a second call to a telephone number, you will hear a call waiting tone. Take one of the following actions.

• Reject the second call.

Press the flash key and then press "0".

• Disconnect the first call and answer the second call.

Either press the flash key and press "1", or just hang up the phone and then answer the phone after it rings.

• Put the first call on hold and answer the second call. Press the flash key and then "2".

## European Call Transfer

Do the following to transfer an incoming call (that you have answered) to another phone.

- 1 Press the flash key to put the caller on hold.
- 2 When you hear the dial tone, dial "\*98#" followed by the number to which you want to transfer the call.
- 3 After you hear the ring signal or the second party answers it, hang up the phone.

## **European Three-Way Conference**

Use the following steps to make three-way conference calls.

- 1 When you are on the phone talking to someone, press the flash key to put the caller on hold and get a dial tone.
- 2 Dial a phone number directly to make another call.
- 3 When the second call is answered, press the flash key and press "3" to create a three-way conversation.
- 4 Hang up the phone to drop the connection.
- 5 If you want to separate the activated three-way conference into two individual connections (one is online, the other is on hold), press the flash key and press "2".

#### 19.10.2.3 USA Type Supplementary Services

This section describes how to use supplementary phone services with the **USA Type Call Service Mode**. Commands for supplementary services are listed in the table below. After pressing the flash key, if you do not issue the sub-command before the default sub-command timeout (2 seconds) expires or issue an invalid sub-command, the current operation will be aborted.

| COMMAND | SUB-COMMAND | DESCRIPTION  |
|---------|-------------|--|
| Flash   |             | Put a current call on hold to place a second call. After the second call is successful, press the flash key again to have a three-way conference call. |
|         |             | Put a current call on hold to answer an incoming call.   |
| Flash   | *98#        | Transfer the call to another phone.  |

Table 108 USA Flash Key Commands

### **USA Call Hold**

Call hold allows you to put a call (A) on hold by pressing the flash key.

If you have another call, press the flash key to switch back and forth between caller **A** and **B** by putting either one on hold.

If you hang up the phone but a caller is still on hold, there will be a remind ring.

### **USA Call Waiting**

This allows you to place a call on hold while you answer another incoming call on the same telephone (directory) number.

If there is a second call to your telephone number, you will hear a call waiting tone.

Press the flash key to put the first call on hold and answer the second call.

#### **USA Call Transfer**

Do the following to transfer an incoming call (that you have answered) to another phone.

- 1 Press the flash key to put the caller on hold.
- 2 When you hear the dial tone, dial "\*98#" followed by the number to which you want to transfer the call.
- 3 After you hear the ring signal or the second party answers it, hang up the phone.

#### USA Three-Way Conference

Use the following steps to make three-way conference calls.

- 1 When you are on the phone talking to someone (party A), press the flash key to put the caller on hold and get a dial tone.
- 2 Dial a phone number directly to make another call (to party B).
- **3** When party B answers the second call, press the flash key to create a three-way conversation.
- 4 Hang up the phone to drop the connection.

#### 265

- 5 If you want to separate the activated three-way conference into two individual connections (with party A on-line and party B on hold), press the flash key.
- 6 If you want to go back to the three-way conversation, press the flash key again.
- 7 If you want to separate the activated three-way conference into two individual connections again, press the flash key. This time the party B is on-line and party A is on hold.

#### 19.10.2.4 Phone Functions Summary

The following table shows the key combinations you can enter on your phone's keypad to use certain features.

| ACTION | FUNCTION                     | DESCRIPTION   |  |
|--------|------------------------------|---|--|
| *98#   | Call transfer                | Transfer a call to another phone. See Section 19.10.2.2 on page 263<br>(Europe type) and Section 19.10.2.3 on page 264 (USA type).  |  |
| *66#   | Call return                  | Place a call to the last person who called you.   |  |
| *95#   | Enable Do Not Disturb        | Use these to set your phone not to ring when someone calls you, or to   |  |
| #95#   | Disable Do Not Disturb       | turn this function off.   |  |
| *41#   | Enable Call Waiting          | Use these to allow you to put a call on hold when you are answering another, or to turn this function off.  |  |
| #41#   | Disable Call Waiting         |   |  |
| ***    | IVR                          | Use these to set up Interactive Voice Response (IVR). IVR allows you to record custom caller ringing tones (the sound a caller hears before you pick up the phone) and on hold tones (the sound someone hears when you put their call on hold). |  |
| ####   | Internal Call                | Call the phone(s) connected to the Zyxel Device.  |  |
| *82    | One Shot Caller Display Call | Activate or deactivate caller ID for the next call only.  |  |
| *67    | One Shot Caller Hidden Call  |   |  |

#### Table 109 Phone Functions Summary

# Chapter 20 Log

# 20.1 Log Overview

These screens allow you to determine the categories of events and/or alerts that the Zyxel Device logs and then display these logs or have the Zyxel Device send them to an administrator (through email) or to a syslog server.

# 20.1.1 What You Can Do in this Chapter

- Use the System Log screen to see the system logs (Section 20.2 on page 268).
- Use the Security Log screen to see the security-related logs for the categories that you select (Section 20.3 on page 269).

# 20.1.2 What You Need To Know

The following terms and concepts may help as you read this chapter.

#### Alerts and Logs

An alert is a type of log that warrants more serious attention. They include system errors, attacks (access control) and attempted access to blocked web sites. Some categories such as **System Errors** consist of both logs and alerts. You may differentiate them by their color in the **View Log** screen. Alerts display in red and logs display in black.

#### **Syslog Overview**

The syslog protocol allows devices to send event notification messages across an IP network to syslog servers that collect the event messages. A syslog-enabled device can generate a syslog message and send it to a syslog server.

Syslog is defined in RFC 3164. The RFC defines the packet format, content and system log related information of syslog messages. Each syslog message has a facility and severity level. The syslog facility identifies a file in the syslog server. Refer to the documentation of your syslog program for details. The following table describes the syslog severity levels.

| CODE | SEVERITY   |
|------|--|
| 0    | Emergency: The system is unusable.                   |
| 1    | Alert: Action must be taken immediately.             |
| 2    | Critical: The system condition is critical.          |
| 3    | Error: There is an error condition on the system.    |
| 4    | Warning: There is a warning condition on the system. |

Table 110 Syslog Severity Levels

267

| CODE | SEVERITY   |
|------|--|
| 5    | Notice: There is a normal but significant condition on the system. |
| 6    | Informational: The syslog contains an informational message.       |
| 7    | Debugging: The message is intended for debug-level purposes.       |

Table 110 Syslog Severity Levels (continued)

# 20.2 System Log

Use the **System Log** screen to see the system logs. You can filter the entries by selecting a severity level and/or category. Click **System Monitor** > **Log** to open the **System Log** screen.

Figure 166 System Monitor > Log > System Log

| Use the | System Log scre | en to see the system lo | gs. You can filter the | entries by selecting a sever | ity level and/or category. |
|---------|-----------------|-------------------------|------------------------|------------------------------|----------------------------|

Table 112 System Monitor > Log > Security Log

# CHAPTER 21 Traffic Status

# 21.1 Traffic Status Overview

Use the Traffic Status screens to look at the network traffic status and statistics of the WAN/LAN interfaces and NAT.

# 21.1.1 What You Can Do in this Chapter

- Use the WAN screen to view the WAN traffic statistics (Section 21.2 on page 270).
- Use the LAN screen to view the LAN traffic statistics (Section 21.3 on page 271).

# 21.2 WAN Status

Click **System Monitor** > **Traffic Status** to open the **WAN** screen. The figures in this screen show the number of bytes received and sent through the Zyxel Device's WAN interface. The table below shows packet statistics for each WAN interface.

270

The following table describes the fields in this screen.

| LABEL                  | DESCRIPTION  |
|------------------------|--|
| Refresh Interval       | Select how often you want the Zyxel Device to update this screen.              |
| Connected<br>Interface | This shows the name of the WAN interface that is currently connected.          |
| Packets Sent           |  |
| Data                   | This indicates the number of transmitted packets on this interface.            |
| Error                  | This indicates the number of frames with errors transmitted on this interface. |
| Drop                   | This indicates the number of outgoing packets dropped on this interface.       |
| Packets Received       |  |
| Data                   | This indicates the number of received packets on this interface.               |
| Error                  | This indicates the number of frames with errors received on this interface.    |
| Drop                   | This indicates the number of received packets dropped on this interface.       |
| Disabled<br>Interface  | This shows the name of the WAN interface that is currently disabled.           |
| Packets Sent           |  |
| Data                   | This indicates the number of transmitted packets on this interface.            |
| Error                  | This indicates the number of frames with errors transmitted on this interface. |
| Drop                   | This indicates the number of outgoing packets dropped on this interface.       |
| Packets Received       | 1  |
| Data                   | This indicates the number of received packets on this interface.               |
| Error                  | This indicates the number of frames with errors received on this interface.    |
| Drop                   | This indicates the number of received packets dropped on this interface.       |

Table 113 System Monitor > Traffic Status > WAN

# 21.3 LAN Status

Click **System Monitor** > **Traffic Status** > **LAN** to open the following screen. This screen allows you to view packet statistics for each LAN or WLAN interface on the Zyxel Device.

|                    |                            | Traffi               | c Status        | 5                                   |                  |  |
|--------------------|----------------------------|----------------------|-----------------|-------------------------------------|------------------|--|
| AN LAN             |                            |                      |                 |                                     |                  |  |

Table 115 System Monitor > VoIP Status

| LABEL           | DESCRIPTION   |
|-----------------|---|
| Poll Interval   | Enter the number of seconds the Device needs to wait before updating this screen and then click <b>Set Interval</b> . Click <b>Stop</b> to have the Device stop updating this screen.   |
| SIP Status      |   |
| Account         | This column displays each SIP account in the Device.  |
| Register Action | Click on this switch to register/unregister the SIP account. This switch will turn blue if a registration attempt is successful; otherwise, it will revert to its unregistered setting.<br>Unregistering an account does not delete the SIP account itself, but removes the mapping between your SIP identity and your IP address or domain name, |

| LABEL                   | DESCRIPTION  |
|-------------------------|--|
| Registration            | This field displays the current registration status of the SIP account. You can change this in the Status screen. Registered – The SIP account is registered with a SIP server. Not Registered – The last time the Device tried to register the SIP account with the SIP server, the attempt failed. The Device automatically tries to register the SIP account when you turn on the Device or when you activate it. Inactive – The SIP account is not active. You can activate it in VoIP > SIP > SIP Account.  |
| Registration Time       | This field displays the last time the Device successfully registered the SIP account. The field is blank if the Device has never successfully registered this account.   |
| URI                     | This field displays the account number and service domain of the SIP account. You can change these in the VoIP > SIP screen.   |
| Message Waiting         | This field indicates whether or not there are any messages waiting for the SIP account.  |
| Last Incoming<br>Number | This field displays the last number that called the SIP account. The field is blank if no number has ever dialed the SIP account.  |
| Last Outgoing<br>Number | This field displays the last number the SIP account called. The field is blank if the SIP account has never dialed a number.   |
| Call Status             |  |
| Account                 | This column displays each SIP account in the Device.   |
| Duration                | This field displays how long the current call has lasted.  |
| Status                  | This field displays the current state of the phone call.   |
|                         | Idle – There are no current VoIP calls, incoming calls or outgoing calls being made.   |
|                         | Dial – The callee's phone is ringing.  |
|                         | Ring – The phone is ringing for an incoming VoIP call.   |
|                         | Process – There is a VoIP call in progress.  |
|                         | DISC – The callee's line is busy, the callee hung up or your phone was left off the hook.  |
| Call Type               | This field displays the call direction type of the current VoIP call. Outgoing Call – It is a SIP VoIP call made by local phone ports, and this SIP account is able to issue a (SIP-based) call setup to the SIP account of remote peers for a VoIP call establishment. This (SIP-based) call setup signal is sent to the SIP server first, and then the SIP server would relay it to the target peer after correctly resolving and locating the target peer. During the call setup (signaling) phase, Calling state is displayed in the Status field, and it turns to InCall state once the call is successfully established.   |
|                         | Incoming Call – It is a SIP VoIP call made or originated by remote SIP accounts to connect to this local SIP account. One or more local phone ports can be configured to receive this type of call, see the Incoming Number below, and all of them should begin to ring during the call setup (signaling phase), see the Status above. Once some remote SIP accounts start to ring one local phone, answer by off-hook to the call, and the call is successfully established. The other ringing local phone ports will stop ringing and turning to InCall state in the Status field.   |
|                         | Internal Call – It is a local VoIP call between two different local phone ports. No SIP signaling is needed and thus no SIP server is involved to establish this type of call. This type of call is established through the Internal and Non-SIP local setup signaling procedure between the call- originating and call-terminating local phone ports. In general, one or more local phone ports can be designed to receive this type of call, and once any of the ringing phones answer the call, the other ringing ones will stop ringing. During the call setup phase (signaling phase), Calling state is displayed in Status field, and turns to InCall state once the call is successfully established. |
| Codec                   | This field displays what voice codec is being used for a current VoIP call through a phone port.   |

 Table 115
 System Monitor > VoIP Status (continued)

| LABEL                   | DESCRIPTION  |
|-------------------------|--|
| From Phone Port<br>Type | This field displays the phone ports type used to originate, start, or create the current VoIP call.<br>Type Two possible type values will be displayed here: SIP – For the current call which is<br>categorized as Incoming Call in the Call Type filed, this field will show the type SIP. FXS – As for<br>the other cases: Outgoing Call and Internal Call, this field will show the corresponding local<br>phone port type: FXS, the legacy analog phone port on the device.  |
| To Phone Port Type      | This field displays the phone ports type used to receive the current VoIP call. Three possible type Type values will be displayed here: SIP – For the current call which is categorized as Outgoing Call in the Call Type field, this field will show the type SIP. FXS and Unknown – As for the other cases: Incoming Call and Internal Call, this field will show the corresponding local phone port type: FXS, the legacy analog phone port on the device. While the call is established, this field shows Unknown during the call setup phase (signaling phase). This is because one or more local phone ports can be configured or designed to receive these two types of calls, see the Call Type above, and the local phone port will answer the call that hasn't been determined yet at that time. |
| Peer Number             | This field displays the SIP number of the party that is currently engaged in a VoIP call through a phone port.   |
| Phone Status            |  |
| Phone                   | This field displays the name of a phone port on the Device.  |
| Outgoing Number         | This field displays the SIP number that you use to make calls on this phone port.  |
| Incoming Number         | This field displays the SIP number that you use to receive calls on this phone port.   |
| Hook Status             | This field displays whether the phone is in the on or off hook status.   |
|                         | Off-Hook means a telephone connected to one of the phone port has its receiver off the hook.<br>On-Hook means a telephone connected to one of the phone port has its receiver on the hook.   |

 Table 115
 System Monitor > VoIP Status (continued)

# CHAPTER 23 ARP Table

# 23.1 ARP Table Overview

Address Resolution Protocol (ARP) is a protocol for mapping an Internet Protocol (IP) address to a physical machine address, known as a Media Access Control (MAC) address, on the local area network.

An IP version 4 address is 32 bits long. MAC addresses are 48 bits long. The ARP table maintains an association between each MAC address and its corresponding IP address.

# 23.1.1 How ARP Works

When an incoming packet destined for a host device on a local area network arrives at the device, the device's ARP program looks in the ARP table and, if it finds the address, sends it to the device.

# 23.2 ARP Table

Use the ARP table to view the IPv4-to-MAC address mappings for each device connected to the Zyxel Device. The neighbor table shows the IPv6-to-MAC address mappings of each IPv6 neighbor. To open this screen, click **System Monitor > ARP Table**.

276

| #                      | This is the ARP table entry number.  |
| IPv4 / IPv6<br>Address | This is the learned IPv4 or IPv6 IP address of a device connected to the Zyxel Device.                                       |
| MAC Address            | This is the MAC address of the connected device with the listed IP address.  |
| Device                 | This is the type of interface used by the connected device. You can click the device type to go to its configuration screen. |

#### Table 116 System Monitor > ARP Table

# CHAPTER 24 Routing Table

# 24.1 Routing Table Overview

Routing is based on the destination address only and the Zyxel Device takes the shortest path to forward a packet.

# 24.2 Routing Table

The table below shows IPv4 and IPv6 routing information. The IPv4 subnet mask is '255.255.255.255' for a host destination and '0.0.0.0' for the default route. The gateway address is written as '\*'(IPv4)/'::'(IPv6) if none is set.

Click System Monitor > Routing Table to open the following screen.

| Table 117 | System I | Nonitor > | Routing | Table |
|-----------|----------|-----------|---------|-------|
|-----------|----------|-----------|---------|-------|

| LABEL                     | DESCRIPTION   |  |
|---------------------------|---|--|
| IPv4 / IPv6 Routing Table |   |  |
| Destination               | This indicates the destination IPv4 address or IPv6 address and prefix of this route.                   |  |
| Gateway                   | This indicates the IPv4 address or IPv6 address of the gateway that helps forward this route's traffic. |  |
| Subnet Mask               | This indicates the destination subnet mask of the IPv4 route.   |  |

|           | - · · · ·         |                 |             |
|-----------|-------------------|-----------------|-------------|
| Table 117 | System Monitor    | > Routing Table | (continued) |
|           | 5,510111101011101 |                 |             |

| LABEL     | DESCRIPTION   |
|-----------|---|
| Flag      | This indicates the route status.  |
|           | U-Up: The route is up.  |
|           | !-Reject: The route is blocked and will force a route lookup to fail.   |
|           | G-Gateway: The route uses a gateway to forward traffic.   |
|           | H-Host: The target of the route is a host.  |
|           | R-Reinstate: The route is reinstated for dynamic routing.   |
|           | D-Dynamic (redirect): The route is dynamically installed by a routing daemon or redirect.   |
|           | M-Modified (redirect): The route is modified from a routing daemon or redirect.   |
| Metric    | The metric represents the "cost of transmission." A router determines the best route for transmission by choosing a path with the lowest "cost." The smaller the number, the lower the "cost."  |
| Interface | This indicates the name of the interface through which the route is forwarded.  |
|           | <ul> <li>brx indicates a LAN interface where x can be 0 – 3 to represent LAN1 to LAN4 respectively.</li> <li>ethx indicates an Ethernet WAN interface using IPoE or in bridge mode.</li> <li>ppp0 indicates a WAN interface using PPPoE.</li> <li>wlx indicates a wireless interface where x can be 0 – 1.</li> </ul> |

# CHAPTER 25 WLAN Station Status

# 25.1 WLAN Station Status Overview

Click **System Monitor** > **WLAN Station Status** to open the following screen. Use this screen to view information and status of the wireless stations (WiFi clients) that are currently associated with the Zyxel Device. Being associated means that a WiFi client (for example, your computer with a WiFi network card installed) has connected successfully to an AP (or WiFi router) using the same SSID, channel, and WiFi security settings.

| ML/MAZ | .4G Station Status     |             |            |     |       |
|--------|------------------------|-------------|------------|-----|-------|
| #      | MAC Address            | Rate (Mbps) | RSSI (dBm) | SNR | Level |
| WLAN 5 | G Station Status       |             |            |     |       |
| #      | MAC Address            | Rate (Mbps) | RSSI (dBm) | SNR | Level |
| WLAN E | asyMesh Station Status |             |            |     |       |
| lote   |                        |             |            |     |       |
|        |                        |             |            |     |       |

Figure 173 System Monitor > WLAN Station Status

The following table describes the labels in this screen.

| LABEL       | DESCRIPTION   |
|-------------|---|
| #           | This is the index number of an associated wireless station.   |
| MAC Address | This field displays the MAC address of an associated wireless station.  |
| Rate (Mbps) | This field displays the transmission rate of WiFi traffic between an associated wireless station and the Zyxel Device.  |
| RSSI (dBm)  | The RSSI (Received Signal Strength Indicator) field shows the WiFi signal strength of the station's wireless connection.  |
|             | The normal range is –30dBm to –79dBm. If the value drops below –80dBm, try moving the associated wireless station closer to the Zyxel Device to get better signal strength. |

Table 118 System Monitor > WLAN Station Status

| LABEL | DESCRIPTION  |
|-------|--|
| SNR   | The Signal-to-Noise Ratio (SNR) is the ratio between the received signal power and the received noise power. The greater the number, the better the quality of WiFi.   |
|       | The normal range is 15 to 40. If the value drops below 15, try moving the associated wireless station closer to the Zyxel Device to get better quality WiFi.   |
| Level | This field displays a number which represents the strength of the WiFi signal between an associated wireless station and the Zyxel Device. The Zyxel Device uses the RSSI and SNR values to determine the strength of the WiFi signal. |
|       | 5 means the Zyxel Device is receiving an excellent WiFi signal.  |
|       | 4 means the Zyxel Device is receiving a very good WiFi signal.   |
|       | 3 means the Zyxel Device is receiving a weak WiFi signal,  |
|       | 2 means the Zyxel Device is receiving a very weak WiFi signal.   |
|       | 1 means the Zyxel Device is not receiving a WiFi signal.   |

Table 118 System Monitor > WLAN Station Status (continued)

# CHAPTER 26 Cellular WAN Status

# 26.1 Cellular WAN Status Overview

View the cellular connection details and signal strength value that you can use as reference for positioning the Zyxel Device, as well as SIM card and module information.

# 26.2 Cellular WAN Status

To open this screen, click **System Monitor** > **Cellular WAN Status**. Cellular information is available on this screen only when you insert a valid SIM card in the Zyxel Device.

|  | Cellular WAN Status   |
|--|---|
| View the LTE connection d<br>SIM card and module infor | etails and signal strength value that you can use as reference for positioning the Zyxel Device, as well as mation. |
| Cellular information is avai                           | able on this screen only when you insert a valid SIM card in the Zyxel Device.                                      |

| TAC  | N/A   |

The following table describes the labels in this screen.

| Table 119 | System Monitor > Cellular WAN Status |
|-----------|--------------------------------------|
|           |                                      |

| LABEL                     | DESCRIPTION  |  |  |  |
|---------------------------|--|--|--|--|
| Refresh Interval          | Select the time interval the Zyxel Device will check and refresh the fields shown on this screen.<br>Select <b>None</b> to stop detection.   |  |  |  |
| Module Informati          | on   |  |  |  |
| IMEI                      | This shows the International Mobile Equipment Identity of the Zyxel Device.  |  |  |  |
| Module SW<br>Version      |  |  |  |  |
| SIM Status                |  |  |  |  |
| SIM Card Status           | This displays the SIM card status:   |  |  |  |
|                           | None – the Zyxel Device does not detect that there is a SIM card inserted.   |  |  |  |
|                           | Waiting SIM Available – the SIM card is detected but not available yet.  |  |  |  |
|                           | Available – the SIM card could either have or doesn't have PIN code security.  |  |  |  |
|                           | Locked – the SIM card has PIN code security, but you did not enter the PIN code yet.   |  |  |  |
|                           | <b>Blocked</b> – you entered an incorrect PIN code too many times, so the SIM card has been locked; call the ISP for a PUK (Pin Unlock Key) to unlock the SIM card.  |  |  |  |
|                           | Error - the Zyxel Device detected that the SIM card has errors.  |  |  |  |
| IMSI                      | This displays the International Mobile Subscriber Identity (IMSI) of the installed SIM card. An IMS a unique ID used to identify a mobile subscriber in a mobile network.  |  |  |  |
| ICCID                     | Integrated Circuit Card Identifier (ICCID). This is the serial number of the SIM card.   |  |  |  |
| PIN Protection            | A PIN (Personal Identification Number) code is a key to a SIM card. Without the PIN code, you cannot use the SIM card.   |  |  |  |
|                           | Shows <b>Enable</b> if the service provider requires you to enter a PIN to use the SIM card.   |  |  |  |
|                           | Shows <b>Disable</b> if the service provider lets you use the SIM without inputting a PIN.   |  |  |  |
| PIN Remaining<br>Attempts | This is how many more times you can try to enter the PIN code before the ISP blocks your SIM card.   |  |  |  |
| IP Passthrough St         | atus   |  |  |  |
| IP Passthrough            | This displays if IP Passthrough is enabled on the Zyxel Device.  |  |  |  |
| Enable                    | IP Passthrough allows a LAN computer on the local network of the Zyxel Device to have access to web services using the public IP address. When IP Passthrough is configured, all traffic is forwarded to the first LAN computer on the local network and will not go through NAT.              |  |  |  |
| IP Passthrough            | This displays the IP Passthrough mode.   |  |  |  |
| Mode                      | This displays <b>Dynamic</b> and the Zyxel Device will allow traffic to be forwarded to the first LAN computer requesting an IP address from the Zyxel Device.   |  |  |  |
|                           | This displays <b>Fixed</b> and the Zyxel Device will allow traffic to be forwarded to a specific LAN computer on the local network of the Zyxel Device.  |  |  |  |
| Cellular Status           |  |  |  |  |
| Cellular Status           | This displays the status of the cellular Internet connection.  |  |  |  |
| Data Roaming              | This displays if data roaming is enabled on the Zyxel Device.  |  |  |  |
|                           | Data roaming is to use your Zyxel Device in an area which is not covered by your service provider. Enable roaming to ensure that your Zyxel Device is kept connected to the Internet when you are traveling outside the geographical coverage area of the network to which you are registered. |  |  |  |
| Operator                  | This displays the name of the service provider.  |  |  |  |

| LABEL                 | DESCRIPTION  |  |  |  |
|-----------------------|--|--|--|--|
| PLMN                  | This displays the PLMN number.   |  |  |  |
| Service Information   |  |  |  |  |
| Access<br>Technology  | This displays the type of the mobile network (such as LTE, UMTS, GSM) to which the Zyxel Device connecting.  |  |  |  |
| Band                  | This displays the current cellular band of your Zyxel Device.  |  |  |  |
| RSSI                  | This displays the strength of the WiFi signal between an associated wireless station and an AP.  |  |  |  |
|                       | The normal range is –30dBm to –79dBm. If the value drops below –80dBm, try moving the associated wireless station closer to the Zyxel Device to get better signal strength.  |  |  |  |
| Cell ID               | This shows the cell ID, which is a unique number used to identify the Base Transceiver Station to which the Zyxel Device is connecting.  |  |  |  |
|                       | The value depends on the Current Access Technology:  |  |  |  |
|                       | <ul> <li>For GPRS, it is the Cell Identity as specified in 3GPP-TS.25.331.</li> <li>For UMTS, it is the Cell Identity as defined in SIB3 3GPP-TS.25.331, 3GPP-TS.24.008.</li> <li>For LTE, it is the 28-bit binary number Cell Identity as specified in SIB1 in 3GPP-TS.36.331.</li> </ul> |  |  |  |
|                       | The value is '0' (zero) or 'N/A' if there is no network connection.  |  |  |  |
| Physical Cell ID      | This shows the Physical Cell ID (PCI), which are queries and replies between the Zyxel Device and the mobile network it is connecting to. The normal range is 1 to 504.  |  |  |  |
| UL Bandwidth<br>(MHz) | This shows the cellular channel bandwidth from the Zyxel Device to the base station. According to 3GPP specifications, the bandwidths defined by the standard are 1.4, 3, 5, 10, 15, and 20 MHz. The wider the bandwidth the higher the throughput.  |  |  |  |
| DL Bandwidth<br>(MHz) | This shows the cellular channel bandwidth from the base station to the Zyxel Device. According to 3GPP specifications, the bandwidths defined by the standard are 1.4, 3, 5, 10, 15, and 20 MHz. The wider the bandwidth the higher the throughput.  |  |  |  |
| RFCN                  | This displays the Radio Frequency Channel Number of DL carrier frequency used by the mobile network to which the Zyxel Device is connecting.   |  |  |  |
|                       | The value depends on the Current Access Technology:  |  |  |  |
|                       | • For GPRS, it is the ARFCN (Absolute Radio-Frequency Channel Number) as specified in 3GPP-<br>TS.45.005.  |  |  |  |
|                       | <ul> <li>For UMTS, it is the UARFCN (UTRA Absolute Radio-Frequency Channel Number) as specified in<br/>3GPP-TS.25.101.</li> </ul>  |  |  |  |
|                       | <ul> <li>For LTE, it is the EARFCN (E-UTRA Absolute Radio-Frequency Channel Number) as specified in<br/>3GPP-TS.36.101.</li> </ul>   |  |  |  |
|                       | The value is '0' (zero) or 'N/A' if there is no network connection.  |  |  |  |
| RSRP                  | This displays the Reference Signal Receive Power (RSRP), which is the average received power of all Resource Element (RE) that carry cell-specific Reference Signals (RS) within the specified bandwidth.  |  |  |  |
|                       | The received RSRP level of the connected E-UTRA cell, in dBm, is as specified in 3GPP-TS.36.214. The reporting range is specified in 3GPP-TS.36.133.   |  |  |  |
|                       | An undetectable signal is indicated by the lower limit, example –140 dBm.  |  |  |  |
|                       | This parameter is for LTE only. The normal range is $-30$ to $-140$ . The value is $-140$ if the Current Access Technology is not LTE. The value is 'N/A' if there is no network connection.   |  |  |  |
| RSRQ                  | This displays the Reference Signal Receive Quality (RSRQ), which is the ratio of RSRP to the E-UTRA carrier RSSI and indicates the quality of the received reference signal.   |  |  |  |
|                       | The received RSRQ level of the connected E-UTRA cell, in 0.1 dB, is as specified in 3GPP-TS.36.214. An undetectable signal is indicated by the lower limit, example -240.  |  |  |  |
|                       | This parameter is for LTE only. The normal range is –30 to –240. The value is –240 if the Current Access Technology is not LTE. The value is 'N/A' if there is no network connection.  |  |  |  |

 Table 119
 System Monitor > Cellular WAN Status (continued)

| LABEL | DESCRIPTION  |  |
|-------|--|--|
| RSCP  | This displays the Received Signal Code Power, which measures the power of channel used by the Zyxel Device.  |  |
|       | The received signal level, in dBm, is of the CPICH channel (Ref. 3GPP TS 25.133). An undetectable signal is indicated by the lower limit, example –120 dBm.  |  |
|       | This parameter is for UMTS only. The normal range is $-30$ to $-120$ . The value is $-120$ if the Current Access Technology is not UMTS. The value is 'N/A' if there is no network connection.   |  |
| EcNo  | This displays the ratio (in dB) of the received energy per chip and the interference level.  |  |
|       | The measured EcNo is in 0.1 dB and is received in the downlink pilot channel. An undetectable signal is indicated by the lower limit, for example, $-240$ dB.  |  |
|       | This parameter is for UMTS only. The normal range is $-30$ to $-240$ . The value is $-240$ if the Current Access Technology is not UMTS or there is no network connection.   |  |
| TAC   | This displays the Tracking Area Code (TAC), which is used to identify the country of a mobile subscriber.  |  |
|       | The physical cell ID of the connected E-UTRAN cell, is as specified in 3GPP-TS.36.101.   |  |
|       | This parameter is for LTE only. The value is '0' (zero) or 'N/A' if the Current Access Technology is not LTE or there is no network connection.  |  |
| LAC   | This displays the 2-octet Location Area Code (LAC), which is used to identify a location area within a PLMN.   |  |
|       | The LAC of the connected cell is as defined in SIB 1 [3GPP-TS.25.331]. The concatenation of PLMN ID (MCC+MNC) and LAC uniquely identifies the LAI (Location Area ID) [3GPP-TS.23.003].   |  |
|       | This parameter is for UMTS or GPRS. The value is '0' (zero) if the Current Access Technology is not UMTS or GPRS. The value is 'N/A' if there is no network connection.  |  |
| RAC   | This displays the RAC (Routing Area Code), which is used in mobile network "packet domain service" (PS) to identify a routing area within a location area.   |  |
|       | In a mobile network, it uses LAC (Location Area Code) to identify the geographical location for the old 3G voice only service, and use RAC to identify the location of data service like HSDPA or LTE.   |  |
|       | The RAC of the connected UTRAN cell is as defined in SIB 1 [3GPP-TS.25.331]. The concatenation of PLMN ID (MCC+MNC), LAC, and RAC uniquely identifies the RAI (Routing Area ID) [3GPP-TS.23.003].  |  |
|       | This parameter is for UMTS or GPRS. The value is '0' (zero) if the Current Access Technology is not UMTS or GPRS. The value is 'N/A' if there is no network connection.  |  |
| BSIC  | The Base Station Identity Code (BSIC), which is a code used in GSM to uniquely identify a base station.  |  |
|       | This parameter is for GPRS only. The value is '0' (zero) if the Current Access Technology is not GPRS. The value is 'N/A' if there is no network connection.   |  |
| SINR  | This displays the Signal to Interference plus Noise Ratio (SINR) in dB. This is also a measure of signal quality and used by the UE (User Equipment) to calculate the Channel Quality Indicator (CQI) that it reports to the network. A negative value means more noise than signal. |  |
| CQI   | This displays the Channel Quality Indicator (CQI). It is an indicator carrying the information on how good/bad the communication channel quality is.   |  |
| MCS   | MCS stands for modulation coding scheme. The base station selects MCS based on current radio conditions. The higher the MCS the more bits can be transmitted per time unit.  |  |
| RI    | This displays the Rank Indication, one of the control information that a UE will report to eNodeB (Evolved Node-B) on either PUCCH (Physical Uplink Control Channel) or PUSCH (Physical Uplink Shared Channel) based on uplink scheduling.   |  |

 Table 119
 System Monitor > Cellular WAN Status (continued)

| LABEL              | DESCRIPTION   |
|--------------------|---|
| PMI                | This displays the Precoding Matrix Indicator (PMI).   |
|                    | PMI is for transmission modes 4 (closed loop spatial multiplexing), 5 (multi-user MIMO), and 6 (closed loop spatial multiplexing using a single layer).   |
|                    | PMI determines how cellular data are encoded for the antennas to improve the downlink rate.   |
| Neighbour Cells    | This displays the type of the neighbor cell's carrier frequency detected by the Zyxel Device.   |
|                    | Intra-Frequency – when the current cell and target cell operate on the same carrier frequency.  |
|                    | Inter-Frequency – when the current cell and target cell operate on different carrier frequencies.   |
| #                  | This is the index number of the entry.  |
| Connection<br>Mode | This displays the connection mode of the detected neighbor cell.  |
| PhyCellID          | This shows the Physical Cell ID ( <b>PCI</b> ), which are queries and replies between the Zyxel Device and the mobile network it is connecting to. The normal range is 0 to 503.  |
| RFCN               | This displays the Radio Frequency Channel Number ( <b>RFCN</b> ) of the detected base station. This is the carrier frequency designated by EARFCN. The range is 0 – 65535.  |
| RSSI               | This displays the Received Signal Strength Indicator ( <b>RSSI</b> ) level of the detected base station.  |
|                    | RSSI is an indicator of the signal strength, including signals and noises received by the target cell.<br>The normal range is –30dBm to –79dBm.   |
| RSRP               | This displays the Reference Symbol Received Power ( <b>RSRP</b> ) level of the detected base station.<br>RSRP is the average signal strength of the target station and is usually measured during a<br>handover. The normal range is -140dBm to -44dBm. |
| RSRQ               | This displays the Reference Signal Received Quality ( <b>RSRQ</b> ) level of the detected base station.<br>RSRQ is the indicator of the signal quality of data transmission. The normal range is -24.0dB to<br>0dB.                                     |
|                    | <b>RSRQ</b> is defined as <b>RSRP/RSSI*</b> N. N is the number of resource blocks. A resource block is the smallest unit of radio resources allocated to a user and contains twelve sub-carriers in frequency and 0.5 ms in time.                       |

## CHAPTER 28 User Account

### 28.1 User Account Overview

In the User Account screen, you can view the settings of the "admin" and other user accounts that you use to log into the Zyxel Device to manage it.

### 28.2 User Account

Click **Maintenance** > **User Account** to open the following screen. Use this screen to create or manage user accounts and their privileges on the Zyxel Device.

| Figure 176 | Maintenance > User Account |

| Lock Period                                      | 5  | Minute(s)(5~90)                                 |
| Group  | Administrator  | -   |

The following table describes the labels in this screen.

Table 122 Maintenance > User Account > User Account Add/Edit

| LABEL           | DESCRIPTION  |
|-----------------|--|
| Active          | Click to enable (switch turns blue) or disable (switch turns gray) to activate or deactivate the user account.   |
| User Name       | Enter a name for this account. Up to 31 printable ASCII characters are allowed except ["], [`], ['], [<], [<], [>], [^], [^], [\$], [], [&], or [;].                     |
| Password        | Enter your new system password. Enter 6 – 64 printable ASCII characters and must contain at least one numeric and one alphabetic character.                              |
|                 | Note that as you type a password, the screen displays a (*) for each character you type. After you change the password, use the new password to access the Zyxel Device. |
|                 | If you are changing your existing password, you have to first enter your <b>Old Password</b> then enter your <b>New Password</b> .                                       |
| Verify Password | Enter the new password again for confirmation.   |
| Retry Times     | Enter the number of times consecutive wrong passwords can be entered for this account. 0 means there is no limit.  |

| LABEL        | DESCRIPTION  |  |
|--------------|--|--|
| Idle Timeout | Enter the length of inactive time before the Zyxel Device will automatically log the user out of the Web Configurator.   |  |
| Lock Period  | Enter the length of time a user must wait before attempting to log in again after a number of consecutive wrong passwords have been entered as defined in <b>Retry Times</b> .   |  |
| Group        | Specify whether this user will have <b>Administrator</b> or <b>User</b> privileges. An <b>Administrator</b> account can access all Web Configurator menus. A <b>User</b> account can only access <b>Monitor</b> and <b>Maintenance</b> menus.<br>The maximum account number of <b>Administrator</b> and <b>User</b> are both four. The total number of the users allowed to log in the Zyxel Device at the same time is eight. |  |
|              | The Administrator privileges are the following:  |  |
|              | <ul> <li>Quick Start setup.</li> <li>The following screens are visible for setup:<br/>Broadband, Wireless, Home Networking, Routing, NAT, DNS, Firewall, MAC Filter, Voice, Log,<br/>Traffic Status, ARP Table, Routing Table, Cellular WAN Status, System, User Account, Remote<br/>Management, TR-069 Client, Time, Email Notification, Log Setting, Firmware Upgrade,<br/>Backup/Restore, Reboot, Diagnostic.</li> </ul>    |  |
|              | <ul> <li>The User privileges are the following:</li> <li>The following screens are visible for setup:<br/>Log, Traffic Status, ARP Table, Routing Table, Cellular WAN Status, User Account, Remote<br/>Management, Time, Email Notification, Log Setting, Firmware Upgrade, Backup/Restore,<br/>Reboot, Diagnostic.</li> </ul>   |  |
| Cancel       | Click Cancel to restore your previously saved settings.  |  |
| OK           | Click <b>OK</b> to save your changes.  |  |

 Table 122
 Maintenance > User Account > User Account Add/Edit (continued)

## CHAPTER 29 Remote Management

## 29.1 Remote Management Overview

Remote management controls through which interfaces, which web services (such as HTTP, HTTPS, FTP, Telnet, SSH and Ping) can access the Zyxel Device.

Note: The Zyxel Device is managed using the Web Configurator.

#### 29.1.1 What You Can Do in this Chapter

- Use the **MGMT Services** screen to allow various approaches to access the Zyxel Device remotely from a WAN and/or LAN connection (Section 29.2 on page 292).
- Use the Trust Domain screen to enable users to permit access from local management services by entering specific IP addresses (Section 29.3 on page 294).
- Use MGMT Services for IP Passthrough to configure which interfaces you can use to access the Zyxel Device for a given service (Section 29.4 on page 295).
- Use Trust Domain for IP Passthrough to view a list of public IP addresses and complete domain names which are allowed to access the Zyxel Device (Section 29.5 on page 296),

### 29.2 MGMT Services

Note: The MGMT Services screen will be hidden if you enable the IP Passthrough function in Network Setting > Broadband > Cellular IP Passthrough screen.

Use this screen to configure the interfaces through which services can access the Zyxel Device. You can also specify service port numbers computers must use to connect to the Zyxel Device. Click **Maintenance > Remote Management > MGMT Services** to open the following screen.

| Remote MGMT enables various approaches to access this device remotely from a WAN and/or LAN connection. |              |            |                 |             |

|           | Multiendice - | Kennole | Munugement  |               |

| LABEL                              | DESCRIPTION   |  |
|------------------------------------|---|--|
| Service Control                    |   |  |
| WAN Interface<br>used for services | Select <b>Any_WAN</b> to have the Zyxel Device automatically activate the remote management service when any WAN connection is up.  |  |
|                                    | Select <b>Multi_WAN</b> and then select one or more WAN connections to have the Zyxel Device activate the remote management service when the selected WAN connections are up. |  |
| Cellular WAN                       | Enable the cellular WAN connection configured in <b>Network Setting</b> > <b>Broadband</b> > <b>Cellular WAN</b> to access the service on the Zyxel Device.                   |  |
|                                    | If there are multiple cellular WANs configured on the Zyxel Device, you can select which to use for the Zyxel Device management.  |  |
| ETHWAN                             | Enable the Ethernet WAN connection configured in <b>Network Setting</b> > <b>Broadband</b> > <b>Ethernet</b><br><b>WAN</b> to access the service on the Zyxel Device.         |  |
| Service                            | This is the service you may use to access the Zyxel Device.   |  |
| LAN/WLAN                           | Select the <b>Enable</b> check box for the corresponding services that you want to allow access to the Zyxel Device from the LAN or WLAN.                                     |  |
| WAN                                | Select the <b>Enable</b> check box for the corresponding services that you want to allow access to the Zyxel Device from all WAN connections.                                 |  |
| Trust Domain                       | Select the <b>Enable</b> check box for the corresponding services that you want to allow access to the Zyxel Device from the trusted host IP address.                         |  |
| Port                               | You may change the server port number for a service if needed, however you must use the same port number in order to use that service for remote management.                  |  |
| Apply                              | Click <b>Apply</b> to save your changes back to the Zyxel Device.   |  |
| Cancel                             | Click Cancel to restore your previously saved settings.   |  |

### 29.3 Trust Domain

Use this screen to view a list of public IP addresses which are allowed to access the Zyxel Device through the services configured in the Maintenance > Remote Management > MGMT Services screen. Click Maintenance > Remote Management > Trust Domain to open the following screen.

Note: Enter the IP address of the management station permitted to access the local management services. If specific services from the trusted hosts are allowed access but the trust domain list is empty, all public IP addresses can access the Zyxel Device from the WAN using the specified services.

Figure 179 Maintenance > Remote Management > Trust Domain

The following table describes the fields in this screen.

| LABEL               | DESCRIPTION   |
|---------------------|---|
| Add Trust<br>Domain | Click this to add a trusted host IP address.                        |
| IP Address          | This field shows a trusted host IP address.                         |
| Delete              | Click the <b>Delete</b> icon to remove the trusted host IP address. |

Table 124 Maintenance > Remote Management > Trust Domain

#### 29.3.1 Add Trust Domain

Use this screen to add a public IP addresses or a complete domain name of a device which is allowed to access the Zyxel Device. Enter the IP address of the management station permitted to access the local management services. If specific services from the trusted-hosts are allowed access but the trust domain list is empty, all public IP addresses can access the Zyxel Device from the WAN using the specified services.

Click the Add Trust Domain button in the Maintenance > Remote Management > Trust Domain screen to open the following screen.

| Cancel     | Click <b>Cancel</b> to restore your previously saved settings.   |

#### 29.4 MGMT Services for IP Passthrough

Configure which interfaces you can use to access the Zyxel Device when IP Passthrough is enabled for a given service. You can also specify the service port numbers computers must use to connect to the Zyxel Device. IP Passthrough allows Internet traffic to go to a LAN computer behind the Zyxel Device without going through NAT. Make sure to enable IP Passthrough in Network Setting > Broadband > Cellular IP Passthrough.

Click Maintenance > Remote Management > MGMT Services for IP Passthrough to open the following screen.

Figure 181 Maintenance > Remote Management > MGMT Services for IP Passthrough

| rvice Control |          |              |       |

### 29.5 Trust Domain for IP Passthrough

Use this screen to view a list of public IP addresses/complete domain names which are allowed to access the Zyxel Device when **IP Passthrough** is enabled. IP Passthrough allows Internet traffic to go to a LAN computer behind the Zyxel Device without going through NAT. Make sure to enable IP Passthrough in **Network Setting > Broadband > Cellular IP Passthrough**.

Click Maintenance > Remote Management > Trust Domain for IP Passthrough to open the following screen.

## CHAPTER 30 TR-069 Client

### 30.1 TR-069 Overview

This chapter explains how to configure the Zyxel Device's TR-069 auto-configuration settings.

## 30.2 TR-069 Client

TR-069 is a protocol that defines how your Zyxel Device can be managed via a management server. TR-069 is based on sending Remote Procedure Calls (RPCs) between an (Auto-Configuration Server) ACS and a client device. RPCs are sent in Extensible Markup Language (XML) format over HTTP or HTTPS. You can use a management server to remotely set up the Zyxel Device, modify settings, perform firmware upgrades as well as monitor and diagnose the Zyxel Device.

Click Maintenance > TR-069 Client to open the following screen.

298

| Allow your Zyxel Device to be              | managed remotely by an Auto Configuration Server (ACS) using TR-069. |  |

The following table describes the fields in this screen.

#### Table 129 Maintenance > TR-069 Client

| LABEL           | DESCRIPTION   |  |
|-----------------|---|--|
| CWMP Active     | CPE WAN Management Protocol (CWMP) enables the Zyxel Device to be remotely configured through a WAN link. Communication between the Zyxel Device and the management server is conducted via SOAP/HTTP(S) in the form of remote procedure calls (RPC). |  |
|                 | Click to enable (switch turns blue) to allow the Zyxel Device to be managed by a management server. Otherwise, click to disable (switch turns gray) to disallow the Zyxel Device to be managed by a management server.                                |  |
| Inform          | Click to enable (switch turns blue) the Zyxel Device to send periodic inform through TR-069 on the WAN. Otherwise, click to disable (switch turns gray).  |  |
| Inform Interval | Enter the time interval (in seconds) at which the Zyxel Device sends information to the auto-<br>configuration server.  |  |
| IP Protocol     | Select the type of IP protocol to allow TR-069 to operate on.   |  |
| ACS URL         | Enter the URL or IP address of the auto-configuration server.   |  |
| ACS User Name   | Enter the TR-069 user name for authentication with the auto-configuration server.   |  |
| ACS Password    | Enter the TR-069 password for authentication with the auto-configuration server.  |  |

| LABEL   | DESCRIPTION  |  |
|---|--|--|
| WAN Interface                                 | Select a WAN interface through which the TR-069 traffic passes.  |  |
| Used by TR-069<br>Client                      | If you select <b>Any_WAN</b> , the Zyxel Device automatically passes the TR-069 traffic when any WAN connection is up.   |  |
|   | If you select <b>Multi_WAN</b> , you also need to select two or more pre-configured WAN interfaces. The Zyxel Device automatically passes the TR-069 traffic when one of the selected WAN connections is up. |  |
| Cellular WAN                                  | The Zyxel Device automatically passes the TR-069 traffic when cellular WAN connection is up.   |  |
| Display SOAP<br>Messages on<br>Serial Console | Click to enable (switch turns blue) the dumping of all SOAP messages during the ACS server communication with the CPE.   |  |
| Connection<br>Request<br>Authentication       | Select this option to enable authentication when there is a connection request from the ACS.   |  |
| Connection                                    | Enter the connection request user name.  |  |
| Request User<br>Name                          | When the ACS makes a connection request to the Zyxel Device, this user name is used to authenticate the ACS.   |  |
| Connection                                    | Enter the connection request password.   |  |
| Request<br>Password                           | When the ACS makes a connection request to the Zyxel Device, this password is used to authenticate the ACS.  |  |
| Connection                                    | This shows the connection request URL.   |  |
| Request URL                                   | The ACS can use this URL to make a connection request to the Zyxel Device.   |  |
| Supplementary<br>ACS URL                      | Enter the URL or IP address of an additional TR-069 auto-configuration server.   |  |
| Supplementary<br>ACS User Name                | Enter the user name of an additional TR-069 auto-configuration server for authentication.  |  |
| Supplementary<br>ACS Password                 | Enter the password of an additional TR-069 auto-configuration server for authentication.   |  |
| Validate ACS<br>Certificate                   | Click to enable (switch turns blue) the validation of a local certificate used by TR-069 client.   |  |
| Local<br>Certificate Used<br>by TR-069 Client | You can choose a local certificate used by TR-069 client. The local certificate should be imported in the <b>Security &gt; Certificates &gt; Local Certificates</b> screen.                                  |  |
| Apply   | Click Apply to save your changes.  |  |
| Cancel  | Click <b>Cancel</b> to restore the screen's last saved settings.   |  |

Table 129 Maintenance > TR-069 Client (continued)

## CHAPTER 31 Time Settings

## 31.1 Time Settings Overview

This chapter shows you how to configure system related settings, such as system date and time.

## 31.2 Time

For effective scheduling and logging, the Zyxel Device system time must be accurate. Use this screen to configure the Zyxel Device's time based on your local time zone. You can enter a time server address, select the time zone where the Zyxel Device is physically located, and configure Daylight Savings settings if needed.

To change your Zyxel Device's time and date, click **Maintenance** > **Time**. The screen appears as shown.

#### Figure 185 Maintenance > Time

## CHAPTER 32 Email Notification

## 32.1 Email Notification Overview

A mail server is an application or a computer that can receive, forward and deliver email messages.

To have the Zyxel Device send reports, logs or notifications through email, you must specify an email server and the email addresses of the sender and receiver.

## 32.2 Email Notification

Use this screen to view, remove and add email account information on the Zyxel Device. This account can be set to send email notifications for logs.

Click Maintenance > E-mail Notification to open the E-mail Notification screen.

Note: The default port number of the mail server is 25.

|                            | If you activate SSL/TLS authentication, the email address must be able to be authenticated by the mail server as well.   |
| Connection<br>Security     | Select <b>SSL</b> to use Secure Sockets Layer (SSL) or Transport Layer Security (TLS) if you want encrypted communications between the mail server and the Zyxel Device. |
|                            | Select STARTTLS to upgrade a plain text connection to a secure connection using SSL/TLS.   |
| Cancel                     | Click this button to begin configuring this screen afresh.   |
| ОК                         | Click this button to save your changes and return to the previous screen.  |

 Table 132
 Maintenance > E-mail Notification > Add (continued)

## CHAPTER 33 Log Setting

## 33.1 Log Setting Overview

You can configure where the Zyxel Device sends logs and which type of logs the Zyxel Device records in the Logs Setting screen.

## 33.2 Log Setting

Use this screen to configure where the Zyxel Device sends logs, and which type of logs the Zyxel Device records.

If you have a server that is running a syslog service, you can also save log files to it by enabling **Syslog Logging**, and then entering the IP address of the server in the **Syslog Server** field. Select **Remote** to store logs on the syslog server, or select **Local File** to store logs on the Zyxel Device. Select **Local File and Remote** to store logs on both the Zyxel Device and the syslog server. To change your Zyxel Device's log settings, click **Maintenance** > **Log Setting**. The screen appears as shown.

| Cancel  | Click <b>Cancel</b> to restore your previously saved settings.  |  |  |  |

Table 133 Maintenance > Log Setting (continued)

#### 33.2.1 Example Email Log

An 'End of Log' message displays for each mail in which a complete log has been sent. The following is an example of a log sent by email.

- You may edit the subject title.
- The date format here is Day-Month-Year.
- The date format here is Month-Day-Year. The time format is Hour-Minute-Second.
- 'End of Log' message shows that a complete log has been sent.

## CHAPTER 34 Firmware Upgrade

### 34.1 Firmware Upgrade Overview

This chapter explains how to upload new firmware to your Zyxel Device. You can download new firmware releases from your nearest Zyxel FTP site (or www.zyxel.com), or check for new firmware online, to use to upgrade your Zyxel Device's performance.

Only use firmware for your Zyxel Device's specific model. Refer to the label on the bottom of your Zyxel Device.

## 34.2 Firmware Upgrade

This screen lets you upload new firmware to your Zyxel Device by using any of the following methods.

- Download the latest firmware file from the Zyxel website. Or,
- Make sure your Zyxel Device is connected to the Internet. Check for new firmware online from the Zyxel server and download the firmware file to the Zyxel Device.

Then upload the firmware file to your Zyxel Device. The upload process uses HTTP (Hypertext Transfer Protocol). The upload may take up to 3 minutes. After a successful upload, the Zyxel Device will reboot.

Click Maintenance > Firmware Upgrade to open the following screen.

#### Do NOT turn off the Zyxel Device while firmware upload is in progress!

NR/FWA Indoor Series User's Guide

The following table describes the labels in this screen.

| LABEL  | DESCRIPTION   |
|--|---|
| Upgrade Firmware                                   |   |
| Reset All<br>Settings After<br>Firmware<br>Upgrade | Select this to reset all your configurations, including Mesh WiFi settings, to the factory defaults after firmware upgrade. Otherwise, make sure this is cleared if you do not want the Zyxel Device to lose all its current configurations and return to the factory defaults. |
|  | Note: Make sure to back up the Zyxel Device's configuration settings first in case the reset all settings process is not successful. Refer to Section 35.2 on page 314.   |
| Current<br>Firmware<br>Version                     | This is the current firmware version.   |
| File Path  | Enter the location of the file you want to upload in this field or click <b>Choose File/Browse</b> to find it.  |
| Choose File/<br>Browse                             | Click this to find the .bin file you want to upload. Remember that you must decompress compressed (.zip) files before you can upload them.  |
| Upload   | Click this to begin the upload process. This process may take up to 3 minutes.  |
| Do Online Firmwar                                  | e Upgrade   |
| Check for<br>Latest<br>Firmware<br>Now             | With the Zyxel Device connected to the Internet, click this to check for new firmware online from the Zyxel server. If a newer firmware is available, follow the online prompt to upload the new firmware to your Zyxel Device.   |

Table 134 Maintenance > Firmware Upgrade

After you see the firmware updating screen, wait a few minutes before logging into the Zyxel Device again.

| Figure 191 | Firmware Uploading |
|------------|--------------------|
|------------|--------------------|

| Firmware Upgrade  |  |  |  |
|---|--|--|--|
| Firmware Upgrade is where you can update the devi<br>download the latest firmware file from the manufactu | ce with newly released features by upgrading the latest firmware. You can<br>rer website of this device. |  |  |
| Upgrade Firmware  | •••  |  |  |
| Restore Default Settings After Firmware Upgrade   |  |  |  |
| Current Firmware Version: #1124501164.048.2   |  |  |  |
| File Path   | Choose File V51345L2163_0419-2.bin Upload  |  |  |

The Zyxel Device automatically restarts in this time causing a temporary network disconnect. In some operating systems, you may see the following icon on your desktop.

Figure 192 Network Temporarily Disconnected

After 2 minutes, log in again and check your new firmware version in the Connection Status screen.

If the upload was not successful, an error screen will appear. Click **OK** to go back to the **Firmware Upgrade** screen.

## CHAPTER 35 Backup/Restore

## 35.1 Backup/Restore Overview

Information related to factory default settings and backup configuration are shown in this screen. You can also use this to restore Zyxel Device's previous configurations.

## 35.2 Backup/Restore

Click **Maintenance** > **Backup/Restore**. Information related to factory defaults, backup configuration, and restoring configuration appears in this screen, as shown next.

#### Figure 194 Maintenance > Backup/Restore

| Backup/Restore   |
|--|
|  |
| Back up and restore your Zyxel Device configurations. You can also reset your Zyxel Device settings back to the factory default.   |
| <b>Backup Configuration</b> allows you to back up (save) the Zyxel Device's current configuration to a file on your computer.<br>Once the Zyxel Device is configured and functioning properly, it is highly recommended that you back up your<br>configuration file before making configuration changes. The backup configuration file will be useful in case you need to<br>return to your previous settings. |
| <b>Restore Configuration</b> allows you to upload a new or previously saved configuration file from your computer to your Zyxel Device.  |
|  |
| Backup Configuration   |
| Click Backup to save the current configuration of your system to your computer.  |
| Backup   |
| Restore Configuration  |
| To restore a previously saved configuration file to your system, browse to the location of the configuration file and click Upload.  |
| File Path Choose File No file chosen Upload  |
|  |
| Back to Factory Default Settings   |
| Click Reset to clear all user-entered configuration information and return to factory default settings. After resetting, the   |
| - Password is printed on a label on the bottom of the device, written after the text "Password".   |
| - LAN IP address will be 192.168.1.1   |
| - DHCP will be reset to default setting  |
| Reset  |

#### **Backup Configuration**

**Backup Configuration** allows you to back up (save) the Zyxel Device's current configuration to a file on your computer. Once your Zyxel Device is configured and functioning properly, it is highly recommended that you back up your configuration file before making configuration changes. The backup configuration file will be useful in case you need to return to your previous settings.

Click **Backup** to save the Zyxel Device's current configuration to your computer.

#### Restore Configuration

**Restore Configuration** allows you to upload a new or previously saved configuration file from your computer to your Zyxel Device.

| LABEL                   | DESCRIPTION   |  |
|-------------------------|---|--|
| File Path               | Enter in the location of the file you want to upload in this field or click <b>Choose File</b> / <b>Browse</b> to find it.            |  |
| Choose File<br>/ Browse | Click this to find the file you want to upload. Remember that you must decompress compressed (.ZIP) files before you can upload them. |  |
| Upload                  | Click this to begin the upload process.   |  |
| Reset                   | Click this to reset your Zyxel Device settings back to the factory default.   |  |

Table 135 Maintenance > Backup/Restore: Restore Configuration

## Do not turn off the Zyxel Device while configuration file upload is in progress.

After the Zyxel Device configuration has been restored successfully, the login screen appears. Login again to restart the Zyxel Device.

The Zyxel Device automatically restarts in this time causing a temporary network disconnect. In some operating systems, you may see the following icon on your desktop.

#### Figure 195 Network Temporarily Disconnected

If you restore the default configuration, you may need to change the IP address of your computer to be in the same subnet as that of the default Zyxel Device IP address (192.168.1.1-192.168.225.225).

If the upload was not successful, an error screen will appear. Click **OK** to go back to the **Configuration** screen.

#### Figure 196 Configuration Upload Error

#### **Reset All Settings**

Click the **Reset** button to clear all user-entered configuration information and return the Zyxel Device to its factory defaults. The following warning screen appears.

| Are you sure you want to restore<br>factory default setting?   |
|--|
| Cancel OK  |
| Figure 198 Reset In Progress   |
| Backup/Restore   |
| You can save the current settings in a backup file on your computer, or restore previous settings from a backup file. You can also reset the device back to its factory default state. |
| Backup Configuration<br>Click Backup to save the current configuration of your system to your computer.<br>Backup  |
| Restore Configuration  |
| To restore a previously saved configuration file to your system, browse to the location of the configuration file and click Upload.  |
| File Path Choose File JRF_UG_VM80213.doc Upload  |

Figure 197 Reset Warning Message

Warning

<

You can also press the **RESET** button on the panel to reset the factory defaults of your Zyxel Device.

#### 35.3 Reboot

System **Reboot** allows you to reboot the Zyxel Device remotely without turning the power off. You may need to do this if the Zyxel Device hangs, for example. This does not affect the Zyxel Device's configuration.

Click Maintenance > Reboot. Click Reboot to have the Zyxel Device reboot.

Figure 199 Maintenance > Reboot

| System Reboot allows you to reboot the Zyxel Device remotely without turning the power off. You may need to do this if the Zyxel Device hangs, for example. This does not affect the Zyxel Device's configuration. |        |  |  |
|--|--------|--|--|
| System Reboot  | Reboot |  |  |

## CHAPTER 36 Diagnostic

## 36.1 Diagnostic Overview

The **Diagnostic** screen displays information to help you identify problems with the Zyxel Device.

#### 36.1.1 What You Can Do in this Chapter

• The **Diagnostic** screen lets you ping an IP address or trace the route packets take to a host (Section 36.2 on page 318).

## 36.2 Diagnostic

Use this screen to ping, traceroute, nslookup, or speed test for troubleshooting. Ping and traceroute are used to test whether a particular host is reachable. After entering an IP address and clicking one of the buttons to start a test, the results will be shown in the **Ping/Traceroute Test** area. Use nslookup to find the IP address for a host name and vice versa. Use speed test to determine the download and upload speed.

Click Maintenance > Diagnostic to open the following screen.

#### Figure 200 Maintenance > Diagnostic

|   | Diag | nostic         |                 |                         |              |                |

Use nslookup<br>to find the IP address for a host name and vice versa. |      |                |                 |                         |              |                |
| Ping/TraceRoute Test  |      |                |                 |                         |              |                |
|   |      |                |                 |                         |              |                |
|   |      |                |                 |                         |              |                |
|   |      |                |                 |                         |              |                |
|   |      |                |                 |                         |              |                |
| TCP/IP  |      |                |                 |                         |              | 11             |
| Address   | Ping | Ping 6         | Trace Route     | Trace Route 6           | Nslookup     | Speed Test     |

The following table describes the fields in this screen.

| LABEL                                     | DESCRIPTION  |  |  |
|---|--|--|--|
| Ping/TraceRoute Test<br>(Diagnostic Test) | The result of tests is shown here in the info area.  |  |  |
| TCP/IP                                    | <u>.</u>   |  |  |
| Address                                   | Enter the IP address of a computer that you want to perform ping, traceroute, or nslookup in order to test a connection.                                 |  |  |
| Ping                                      | Click this button to perform a ping test on the IPv4 address or host name in order to test a connection. The ping statistics will show in the info area. |  |  |
| Ping 6                                    | Click this button to perform a ping test on the IPv6 address or host name in order to test a connection. The ping statistics will show in the info area. |  |  |
| Trace Route                               | Click this button to perform the IPv4 trace route function. This determines the path a packet takes to the specified host.                               |  |  |
| Trace Route 6                             | Click this button to perform the IPv6 trace route function. This determines the path a packet takes to the specified host.                               |  |  |
| Nslookup                                  | Click this button to perform a DNS lookup on the IP address or host name.  |  |  |

#### Table 136 Maintenance > Diagnostic

# PART III Troubleshooting and Appendices

Appendices contain general information. Some information may not apply to your Zyxel Device.

## CHAPTER 37 Troubleshooting

## 37.1 Troubleshooting Overview

This chapter offers some suggestions to solve problems you might encounter. The potential problems are divided into the following categories.

- Power and Hardware Problems
- Device Access Problems
- Cellular Problems
- Internet Problems
- WiFi Problems
- USB Problems
- UPnP Problems

### **37.2 Power and Hardware Problems**

The Zyxel Device does not turn on.

- 1 Make sure you are using the power adapter included with the Zyxel Device.
- 2 Make sure the power adapter is connected to the Zyxel Device and plugged in to an appropriate power source. Make sure the power source is turned on.
- **3** Disconnect and re-connect the power adapter to the Zyxel Device.
- 4 Make sure you have pressed the **POWER** button to turn on the Zyxel Device.
- 5 If the problem continues, contact the vendor.

The LED does not behave as expected.

- 1 Make sure you understand the normal behavior of the LED. See Section 2.2 on page 27.
- 2 Check the hardware connections.

- 3 Inspect your cables for damage. Contact the vendor to replace any damaged cables.
- 4 Turn the Zyxel Device off and on.
- 5 If the problem continues, contact the vendor.

### **37.3 Device Access Problems**

I do not know the IP address of the Zyxel Device.

- 1 The default IP address is 192.168.1.1
- 2 If you changed the IP address, you might be able to find the IP address of the Zyxel Device by looking up the IP address of your computer's default gateway. To do this in Microsoft Windows, click Start > Run, enter cmd, and then enter ipconfig. The IP address of the Default Gateway might be the IP address of the Zyxel Device, depending on your network environment.
- 3 If this does not work, reset the Zyxel Device to its factory defaults. Refer to Section 35.2 on page 314.

I forgot the admin password.

- 1 See the Zyxel Device label or this document's cover page for the default admin password.
- 2 If you changed the password from default and cannot remember the new one, you have to reset the Zyxel Device to its factory default settings. Refer to Section 35.2 on page 314.

I cannot access the Web Configurator login screen.

- 1 Make sure you are using the correct IP address.
  - The default IP address is 192.168.1.1.
  - If you changed the IP address (Section 9.2 on page 151), use the new IP address.
  - If you changed the IP address and have forgotten the new address, see the troubleshooting suggestions for I do not know the IP address of the Zyxel Device.
- 2 Check the hardware connections, and make sure the LEDs are behaving as expected.
- 3 Make sure your Internet browser does not block pop-up windows and has JavaScript and Java enabled.
- 4 Reset the Zyxel Device to its factory default, and try to access the Zyxel Device with the default IP address.

5 If the problem continues, contact the network administrator or vendor, or try one of the advanced suggestions.

#### **Advanced Suggestions**

- Make sure you have logged out of any earlier management sessions using the same user account even if they were through a different interface or using a different browser.
- Try to access the Zyxel Device using another service, such as Telnet. If you can access the Zyxel Device, check the remote management settings and firewall rules to find out why the Zyxel Device does not respond to HTTP.

I cannot log into the Zyxel Device.

- 1 Make sure you have entered the user name and password correctly. The default user name is **admin**. These both user name and password are case-sensitive, so make sure [Caps Lock] is not on.
- 2 You cannot log in to the Web Configurator while someone is using Telnet to access the Zyxel Device. Log out of the Zyxel Device in the other session, or ask the person who is logged in to log out.
- **3** Turn the Zyxel Device off and on.
- 4 If this does not work, you have to reset the Zyxel Device to its factory default.

#### I cannot log into the Zyxel Device using DDNS.

If you connect your Zyxel Device to the Internet and it uses a dynamic WAN IP address, it is inconvenient for you to manage the Zyxel Device from the Internet. The Zyxel Device's WAN IP address changes dynamically. Dynamic DNS (DDNS) allows you to access the Zyxel Device using a domain name.

To use this feature, you have to apply for DDNS service at www.dyndns.org.

Note: If you have a private WAN IP address, then you cannot use DDNS.

Here are the three steps to use a domain name to log in the Web Configurator:

#### Step 1 Register for a DDNS Account on www.dyndns.org

- 1 Open a browser and enter http://www.dyndns.org.
- 2 Apply for a user account. This tutorial uses UserName1 and 12345 as the username and password.
- **3** Log into www.dyndns.org using your account.
- 4 Add a new DDNS host name. This tutorial uses the following settings as an example.
  - Hostname: zyxelrouter.dyndns.org
  - Service Type: Host with IP address
  - IP Address: Enter the WAN IP address that your Zyxel Device is currently using. You can find the IP address on the Zyxel Device's Web Configurator **Status** page.

Then you will need to configure the same account and host name on the Zyxel Device later.

#### Step 2 Configure DDNS on Your Zyxel Device

Configure the following settings in the **Network Setting > DNS > Dynamic DNS** screen.

- Select Enable Dynamic DNS.
- Select www.DynDNS.com as the service provider.
- Enter zyxelrouter.dyndns.org in the Host Name field.
- Enter the user name (UserName1) and password (12345). Click Apply.

#### Step 3 Test the DDNS Setting

Now you should be able to access the Zyxel Device from the Internet. To test this:

- 1 Open a web browser on the computer (using the IP address **a.b.c.d**) that is connected to the Internet.
- 2 Enter http://zyxelrouter.dyndns.org and press [Enter].
- 3 The Zyxel Device's login page should appear. You can then log into the Zyxel Device and manage it.

I cannot connect to the Zyxel Device using Telnet, SSH, or Ping.

- 1 See the Remote Management section for details on allowing web services (such as HTTP, HTTPS, Telnet, SSH and Ping) to access the Zyxel Device.
- 2 Check the server **Port** number field for the web service in the **Maintenance** > **Remote Management** screen. You must use the same port number in order to use that web service for remote management.
- 3 Try the troubleshooting suggestions for I cannot access the Web Configurator login screen. Ignore the suggestions about your browser.

# 37.4 Cellular Problems

The SIM card cannot be detected.

- 1 Disconnect the Zyxel Device from the power supply.
- 2 Remove the SIM card from its slot.
- 3 Clean the SIM card slot of any loose debris using compressed air.
- 4 Clean the gold connectors on the SIM card with a clean lint-free cloth.
- 5 Insert the SIM card into its slot and connect the Zyxel Device to the power supply to restart it.

I get an Invalid SIM card alert.

- 1 Make sure you have an active plan with your ISP.
- 2 Make sure that the Zyxel Device is in the coverage area of a cellular network.

I get a weak cellular signal.

1 Find the location of your nearest cellular base stations, then install the Zyxel Device towards the direction of those sites. The nearest site or site with a direct line-of-sight is usually preferred.

Note: It is best to test towards more than one cellular site, as the nearest site / line-of-sight is not always the best due to the terrain, interference, density of usage, and so on. All of these factors influence the stability, availability and throughput of the link to the Zyxel Device.

- 2 Position the Zyxel Device towards a direction where coverage is expected (example the nearest town).
- 3 Conduct test measurements using the Web Configurator's System Monitor > Cellular WAN Status screen to obtain a report of the cellular network signal strength and quality at various test positions.

Note: It is best to reboot the Zyxel Device before each test measurement is taken to ensure that it is not camping on the previous cellular site. This is because the Zyxel Device can 'lock' onto the previous cellular site even when the new cellular site is at a much better signal level and quality.

Although installing the Zyxel Device as high as possible is the usual rule of thumb, it is sometimes possible that the Zyxel Device is in a weak coverage spot at that specific height. Adjust the height to achieve the best service possible.

Note: Cellular network signals and quality can fluctuate. A measurement taken now and a few moments later can differ substantially even if nothing apparent has changed – this can be due to many aspects, such as fading, reflections, interference, capacity due to high network traffic, and so on.

It is possible that the network topology and usage changes over time, even from one minute to the next as network utilization increases. If poor performance is experienced at a later stage, re-test different installation locations again. It is possible that the current serving cellular site has become over utilized or is out-of-service. As the network design and topology changes, so will the experience change, either for the better or for the worse.

# 37.5 Internet Problems

I cannot access the Internet.

- 1 Check the hardware connections and make sure the LEDs are behaving as expected. See the Quick Start Guide.
- 2 Check the SIM card. Maybe it has wrong settings, the account has expired, it needs to be removed and reinserted (refer to the Quick Start Guide), or it is missing. See Section 37.7 on page 329 for possible SIM card problems.
- 3 Make sure you entered your ISP account information correctly on the **Network Setting** > **Broadband** screen. Fields on this screen are case-sensitive, so check if [Caps Lock] is on of off.
- 4 Check that the WAN interface you are connected to is in the same interface group as the Ethernet connection (Network Setting > Interface Group).
- 5 Make sure you have the Ethernet WAN port connected to a Modem or Router.
- 6 If you set up a WAN connection using bridging service, make sure you turn off the DHCP feature in the Network Setting > Home Networking > LAN Setup screen to have the clients get WAN IP addresses directly from your ISP's DHCP server.
- 7 For models that have optional dual LAN/WAN ports, make sure you converted the LAN port to a WAN port by clicking **Enable** on the **Network Setting** > **Broadband** > **Ethernet WAN** screen. Then make sure you have the Ethernet WAN port connected to a modem or router.
- 8 If you are trying to access the Internet wirelessly, make sure that you enabled the WiFi in the Zyxel Device and your WiFi client and that the WiFi settings in the WiFi client are the same as the settings in the Zyxel Device.
- **9** Disconnect all the cables from your Zyxel Device and reconnect them.
- **10** If the problem continues, contact your ISP.

I cannot connect to the Internet using an Ethernet connection.

- 1 Make sure you have the Ethernet WAN port connected to a Modem or Router.
- 2 Make sure you configured a proper Ethernet WAN interface (**Network Setting** > **Broadband** screen) with the Internet account information provided by your ISP and that it is enabled.
- 3 Check that the WAN interface you are connected to is in the same interface group as the Ethernet connection (Network Setting > Interface Group).
- 4 If you set up a WAN connection using bridging service, make sure you turn off the DHCP feature in the **Network Setting > Home Networking > LAN Setup** screen to have the clients get WAN IP addresses directly from your ISP's DHCP server.

I cannot connect to the Internet using a cellular connection.

- 1 The DSL and Ethernet connections have priority in that order. If the DSL or Ethernet connection is up, then the cellular connection will be down.
- 2 Make sure you have connected a compatible cellular dongle to the USB port, if required.
- **3** Check that the Zyxel Device is within range of a cellular base station.

#### The Internet connection is slow or intermittent.

- 1 There might be a lot of traffic on the network. If the Zyxel Device is sending or receiving a lot of information, try closing some programs that use the Internet, especially peer-to-peer applications.
- 2 Check the signal strength. Look at the LEDs, and check the LED section for more information. If the signal strength is low, try moving the Zyxel Device closer to the ISP's base station if possible, and look around to see if there are any devices that might be interfering with the wireless network (such as microwaves, other wireless networks).
- 3 For models that support external antennas, connect two external antennas to improve the cellular WAN signal strength. Point the antennas to the base stations directions if you know where they are, or try pointing the antennas in different directions and check which provides the strongest signal to the Zyxel Device. See the Introduction chapter for more information.
- **4** Turn the Zyxel Device off and on.
- 5 If the problem continues, contact the network administrator or vendor, or try the advanced suggestions in I cannot access the Web Configurator login screen.
  - Note: If your Zyxel Device is an outdoor-type, inclement weather like rain and hot weather may affect cellular signals.

# 37.6 WiFi Problems

I cannot connect to the Zyxel Device WiFi.

- 1 Check the WiFi LED status to make sure the Zyxel Device WiFi is on.
- 2 Make sure your WiFi client is within transmission range of the Zyxel Device.
- 3 Make sure you entered the correct SSID and password. See the Zyxel Device back label for the default SSID and password.
- 4 Make sure your WiFi client is using the same WiFi security type (WPA2-PSK, WPA3-SAE, or none) as the Zyxel Device.
- 5 Make sure the WiFi adapter on your WiFi client is working properly. Right-click your computer's network adapter then select **Properties** to check your network adapter status.
- 6 Make sure the WiFi adapter on your WiFi client is IEEE 802.11-compatible and supports the same WiFi standard as the Zyxel Device radio.

#### The WiFi connection is slow and intermittent.

The following factors may cause interference:

- Obstacles: walls, ceilings, furniture, and so on.
- Building Materials: metal doors, aluminum studs.
- Electrical devices: microwaves, monitors, electric motors, cordless phones, and other wireless devices.

To optimize the speed and quality of your WiFi connection, you can:

- Move your wireless device closer to the AP if the signal strength is low.
- Reduce wireless interference that may be caused by other WiFi networks or surrounding wireless electronics such as cordless phones.
- Place the AP where there are minimum obstacles (such as walls and ceilings) between the AP and the WiFi client.
- Reduce the number of WiFi clients connecting to the same AP simultaneously, or add additional APs if necessary.
- Try closing some programs that use the Internet, especially peer-to-peer applications. If the WiFi client is sending or receiving a lot of information, it may have too many programs open that use the Internet.
- Place the Zyxel Device where there are minimum obstacles (such as walls and ceilings) between the Zyxel Device and the WiFi client. Avoid placing the Zyxel Device inside any type of box that might block WiFi signals.

# 37.7 USB Problems

The Zyxel Device fails to detect my USB device.

- 1 Disconnect the USB device.
- 2 Reboot the Zyxel Device.
- 3 If you are connecting a USB hard drive that comes with an external power supply, make sure it is connected to an appropriate power source that is on.
- 4 Reconnect your USB device to the Zyxel Device.

# 37.8 UPnP Problems

My computer cannot detect UPnP settings from the Zyxel Device.

- 1 Make sure that UPnP is enabled in your computer. For Windows 10, see Section 9.6 on page 161.
- 2 On the Zyxel Device, make sure that UPnP is enabled on the Network Settings > Home Networking > UPnP screen. See Section 9.4 on page 157 for details.
- 3 Disconnect the Ethernet cable from the Zyxel Device's Ethernet port or from your computer.
- 4 Reconnect the Ethernet cable.
- **5** Restart your computer.

# 37.9 Getting More Troubleshooting Help

Search for support information for your model at *https://service-provider.zyxel.com/global/en/tech-support* and *community.zyxel.com* for more troubleshooting suggestions.

# APPENDIX A Customer Support

In the event of problems that cannot be solved by using this manual, you should contact your vendor. If you cannot contact your vendor, then contact a Zyxel office for the region in which you bought the device.

For Zyxel Communication offices, see *https://service-provider.zyxel.com/global/en/contact-us* for the latest information.

For Zyxel Network offices, see *https://www.zyxel.com/index.shtml* for the latest information.

Please have the following information ready when you contact an office.

#### **Required Information**

- Product model and serial number.
- Warranty Information.
- Date that you received your device.
- Brief description of the problem and the steps you took to solve it.

# APPENDIX B IPv6

#### Overview

IPv6 (Internet Protocol version 6), is designed to enhance IP address size and features. The increase in IPv6 address size to 128 bits (from the 32-bit IPv4 address) allows up to  $3.4 \times 10^{38}$  IP addresses.

#### **IPv6 Addressing**

The 128-bit IPv6 address is written as eight 16-bit hexadecimal blocks separated by colons (:). This is an example IPv6 address 2001:0db8:1a2b:0015:0000:1a2f:0000.

IPv6 addresses can be abbreviated in two ways:

- Leading zeros in a block can be omitted. So 2001:0db8:1a2b:0015:0000:0000:1a2f:0000 can be written as 2001:db8:1a2b:15:0:0:1a2f:0.
- Any number of consecutive blocks of zeros can be replaced by a double colon. A double colon can only appear once in an IPv6 address. So 2001:0db8:0000:0000:1a2f:0000:0000:0015 can be written as 2001:0db8::1a2f:0000:0000:0015, 2001:0db8:0000:0000:1a2f::0015, 2001:db8::1a2f:0:0:15 or 2001:db8:0:0:1a2f::15.

#### Prefix and Prefix Length

Similar to an IPv4 subnet mask, IPv6 uses an address prefix to represent the network address. An IPv6 prefix length specifies how many most significant bits (start from the left) in the address compose the network address. The prefix length is written as "/x" where x is a number. For example,

2001:db8:1a2b:15::1a2f:0/32

means that the first 32 bits (2001:db8) is the subnet prefix.

#### **Link-local Address**

A link-local address uniquely identifies a device on the local network (the LAN). It is similar to a "private IP address" in IPv4. You can have the same link-local address on multiple interfaces on a device. A link-local unicast address has a predefined prefix of fe80::/10. The link-local unicast address format is as follows.

Table 137 Link-local Unicast Address Format

| 1111 1110 10 | 0       | Interface ID |
|--------------|---------|--------------|
| 10 bits      | 54 bits | 64 bits      |

#### **Global Address**

A global address uniquely identifies a device on the Internet. It is similar to a "public IP address" in IPv4. A global unicast address starts with a 2 or 3.

#### **Unspecified Address**

An unspecified address (0:0:0:0:0:0:0:0:0 or ::) is used as the source address when a device does not have its own address. It is similar to "0.0.0.0" in IPv4.

#### **Loopback Address**

A loopback address (0:0:0:0:0:0:0:0:1 or ::1) allows a host to send packets to itself. It is similar to "127.0.0.1" in IPv4.

#### **Multicast Address**

In IPv6, multicast addresses provide the same functionality as IPv4 broadcast addresses. Broadcasting is not supported in IPv6. A multicast address allows a host to send packets to all hosts in a multicast group.

Multicast scope allows you to determine the size of the multicast group. A multicast address has a predefined prefix of ff00::/8. The following table describes some of the predefined multicast addresses.

Table 138 Predefined Multicast Address

| MULTICAST ADDRESS  | DESCRIPTION                            |
|--------------------|--|
| FF01:0:0:0:0:0:0:1 | All hosts on a local node.             |
| FF01:0:0:0:0:0:0:2 | All routers on a local node.           |
| FF02:0:0:0:0:0:0:1 | All hosts on a local connected link.   |
| FF02:0:0:0:0:0:0:2 | All routers on a local connected link. |
| FF05:0:0:0:0:0:0:2 | All routers on a local site.           |
| FF05:0:0:0:0:1:3   | All DHCP severs on a local site.       |

The following table describes the multicast addresses which are reserved and cannot be assigned to a multicast group.

| Table 139 | Reserved  | Multicast | Address    |
|-----------|-----------|-----------|------------|
|           | 100001100 | 1110mcd31 | / (aai 055 |

| MULTICAST ADDRESS  |
|--------------------|
| FF00:0:0:0:0:0:0:0 |
| FF01:0:0:0:0:0:0:0 |
| FF02:0:0:0:0:0:0:0 |
| FF03:0:0:0:0:0:0:0 |
| FF04:0:0:0:0:0:0:0 |
| FF05:0:0:0:0:0:0:0 |
| FF06:0:0:0:0:0:0:0 |
| FF07:0:0:0:0:0:0:0 |
| FF08:0:0:0:0:0:0:0 |
| FF09:0:0:0:0:0:0:0 |
| FF0A:0:0:0:0:0:0:0 |
| FF0B:0:0:0:0:0:0:0 |
| FF0C:0:0:0:0:0:0:0 |
| FF0D:0:0:0:0:0:0:0 |
| FF0E:0:0:0:0:0:0:0 |
| FF0F:0:0:0:0:0:0:0 |
|                    |

#### **Subnet Masking**

#### Interface ID

In IPv6, an interface ID is a 64-bit identifier. It identifies a physical interface (for example, an Ethernet port) or a virtual interface (for example, the management IP address for a VLAN). One interface should have a unique interface ID.

#### EUI-64

The EUI-64 (Extended Unique Identifier) defined by the IEEE (Institute of Electrical and Electronics Engineers) is an interface ID format designed to adapt with IPv6. It is derived from the 48-bit (6-byte) Ethernet MAC address as shown next. EUI-64 inserts the hex digits fffe between the third and fourth bytes of the MAC address and complements the seventh bit of the first byte of the MAC address. See the following example.

#### Table 140

| MAC       |    | 00   | : 13 | : 49 | : 12 | : 34 | : 56 | ]    |
|-----------|----|------|------|------|------|------|------|------|
| Table 141 |    |      |      |      |      |      |      |      |
| EUI-64    | 02 | : 13 | : 49 | : FF | : FE | : 12 | : 34 | : 56 |

#### **Identity Association**

An Identity Association (IA) is a collection of addresses assigned to a DHCP client, through which the server and client can manage a set of related IP addresses. Each IA must be associated with exactly one interface. The DHCP client uses the IA assigned to an interface to obtain configuration from a DHCP server for that interface. Each IA consists of a unique IAID and associated IP information. The IA type is the type of address in the IA. Each IA holds one type of address. IA\_NA means an identity association for non-temporary addresses and IA\_TA is an identity association for temporary addresses. An IA\_NA option contains the T1 and T2 fields, but an IA\_TA option does not. The DHCPv6 server uses T1 and T2 to control the time at which the client contacts with the server to extend the lifetimes on any addresses in the IA\_NA were obtained) a Renew message. If the time T2 is reached and the server does not respond, the client sends a Rebind message to any available server (S2). For an IA\_TA, the client may send a Renew or Rebind message at the client's discretion.

#### **DHCP Relay Agent**

A DHCP relay agent is on the same network as the DHCP clients and helps forward messages between the DHCP server and clients. When a client cannot use its link-local address and a well-known multicast address to locate a DHCP server on its network, it then needs a DHCP relay agent to send a message to a DHCP server that is not attached to the same network.

The DHCP relay agent can add the remote identification (remote-ID) option and the interface-ID option to the Relay-Forward DHCPv6 messages. The remote-ID option carries a user-defined string, such as the system name. The interface-ID option provides slot number, port information and the VLAN ID to the DHCPv6 server. The remote-ID option (if any) is stripped from the Relay-Reply messages before the relay agent sends the packets to the clients. The DHCP server copies the interface-ID option from the Relay-Forward message into the Relay-Reply message and sends it to the relay agent. The interface-ID should not change even after the relay agent restarts.

#### **Prefix Delegation**

Prefix delegation enables an IPv6 router to use the IPv6 prefix (network address) received from the ISP (or a connected uplink router) for its LAN. The Zyxel Device uses the received IPv6 prefix (for example, 2001:db2::/48) to generate its LAN IP address. Through sending Router Advertisements (RAs) regularly by multicast, the Zyxel Device passes the IPv6 prefix information to its LAN hosts. The hosts then can use the prefix to generate their IPv6 addresses.

#### ICMPv6

Internet Control Message Protocol for IPv6 (ICMPv6 or ICMP for IPv6) is defined in RFC 4443. ICMPv6 has a preceding Next Header value of 58, which is different from the value used to identify ICMP for IPv4. ICMPv6 is an integral part of IPv6. IPv6 nodes use ICMPv6 to report errors encountered in packet processing and perform other diagnostic functions, such as "ping".

#### **Neighbor Discovery Protocol (NDP)**

The Neighbor Discovery Protocol (NDP) is a protocol used to discover other IPv6 devices and track neighbor's reachability in a network. An IPv6 device uses the following ICMPv6 messages types:

- Neighbor solicitation: A request from a host to determine a neighbor's link-layer address (MAC address) and detect if the neighbor is still reachable. A neighbor being "reachable" means it responds to a neighbor solicitation message (from the host) with a neighbor advertisement message.
- Neighbor advertisement: A response from a node to announce its link-layer address.
- Router solicitation: A request from a host to locate a router that can act as the default router and forward packets.
- Router advertisement: A response to a router solicitation or a periodical multicast advertisement from a router to advertise its presence and other parameters.

#### IPv6 Cache

An IPv6 host is required to have a neighbor cache, destination cache, prefix list and default router list. The Zyxel Device maintains and updates its IPv6 caches constantly using the information from response messages. In IPv6, the Zyxel Device configures a link-local address automatically, and then sends a neighbor solicitation message to check if the address is unique. If there is an address to be resolved or verified, the Zyxel Device also sends out a neighbor solicitation message. When the Zyxel Device receives a neighbor advertisement in response, it stores the neighbor's link-layer address in the neighbor cache. When the Zyxel Device uses a router solicitation message to query for a router and receives a router advertisement message, it adds the router's information to the neighbor cache, prefix list and destination cache. The Zyxel Device creates an entry in the default router list cache if the router can be used as a default router.

When the Zyxel Device needs to send a packet, it first consults the destination cache to determine the next hop. If there is no matching entry in the destination cache, the Zyxel Device uses the prefix list to determine whether the destination address is on-link and can be reached directly without passing through a router. If the address is unlink, the address is considered as the next hop. Otherwise, the Zyxel Device determines the next-hop from the default router list or routing table. Once the next hop IP address is known, the Zyxel Device looks into the neighbor cache to get the link-layer address and sends the packet when the neighbor is reachable. If the Zyxel Device cannot find an entry in the neighbor cache or the state for the neighbor is not reachable, it starts the address resolution process. This helps reduce the number of IPv6 solicitation and advertisement messages.

#### **Multicast Listener Discovery**

The Multicast Listener Discovery (MLD) protocol (defined in RFC 2710) is derived from IPv4's Internet Group Management Protocol version 2 (IGMPv2). MLD uses ICMPv6 message types, rather than IGMP message types. MLDv1 is equivalent to IGMPv2 and MLDv2 is equivalent to IGMPv3.

MLD allows an IPv6 switch or router to discover the presence of MLD listeners who wish to receive multicast packets and the IP addresses of multicast groups the hosts want to join on its network.

MLD snooping and MLD proxy are analogous to IGMP snooping and IGMP proxy in IPv4.

MLD filtering controls which multicast groups a port can join.

#### MLD Messages

A multicast router or switch periodically sends general queries to MLD hosts to update the multicast forwarding table. When an MLD host wants to join a multicast group, it sends an MLD Report message for that address.

An MLD Done message is equivalent to an IGMP Leave message. When an MLD host wants to leave a multicast group, it can send a Done message to the router or switch. The router or switch then sends a group-specific query to the port on which the Done message is received to determine if other devices connected to this port should remain in the group.

#### Example - Enabling IPv6 on Windows 10

Windows 10 supports IPv6 by default. DHCPv6 is also enabled when you enable IPv6 on a Windows 10 computer.

To enable IPv6 in Windows 10:

- 1 Click the start icon, Settings and then Network & Internet.
- 2 Select the Internet Protocol Version 6 (TCP/IPv6) checkbox to enable it.
- 3 Click OK to save the change.

#### **Regulatory Notice and Statement**

#### EUROPEAN UNION and UNITED KINGDOM

The following information applies if you use the product within the European Union and United Kingdom.

# Declaration of Conformity with Regard to EU Directive 2014/53/EU (Radio Equipment Directive, RED) and UK Regulation

- Compliance information for wireless products relevant to the EU, United Kingdom and other Countries following the EU Directive 2014/53/EU (RED) and UK regulation. And this product may be used in all EU countries (and other countries following the EU Directive 2014/53/EU) and United Kingdom without any limitation except for the countries mentioned below table:
- In the majority of the EU, United Kingdom and other European countries, the 5 GHz bands have been made available for the use of wireless local area networks (LANs). Later in this document you will find an overview of countries in which additional restrictions or requirements or both are applicable. The requirements for any country may evolve. Zyxel recommends that you check with the local authorities for the latest status of their national regulations for the 5 GHz wireless LANs.
- If this device for operation in the band 5150 5350 MHz, it is for indoor use only.
- The maximum RF power operating for each band as follows:
- NR5101
- WCDMA band I/III/VIII is 24 dBm.
- LTE band 1/3/7/8/20/28//34/38/40/42/43 is 23 dBm.
- NR band n41/n77/n78 is 26 dBm.
- WiFi
  - MIFI The band 2400 – 2483.5 MHz is 90.16 mW, The band 5150 – 5350 MHz is 177.42 mW, The band 5470 – 5725 MHz is 451.86 mW.
- NR5103/FWA510
  - WCDMA band I/VIII is 24 dBm.
  - LTE band 1/3/7/8/20/28/38/40/42 is 23 dBm.
  - NR band n1/n3/n28/n38/n78 is 26 dBm.
  - WiFi
  - The band 2400 2483.5 MHz is 90.16 mW, The band 5150 - 5350 MHz is 174.58 mW, The band 5470 - 5725 MHz is 857.04 mW.
- NR5103E
  - WCDMA band I/VIII is 24 dBm.
  - LTE band 1/3/7/8/20/28/38/40/42 is 23 dBm.
  - NR band n1/n3/n28/n38/n78 is 26 dBm.
  - WiFi The band 2400 – 2483.5 MHz is 95.72 mW, The band 5150 – 5350 MHz is 184.08 mW, The band 5470 – 5725 MHz is 618.02 mW.

NR/FWA Indoor Series User's Guide

| Svenska<br>(Swedish) | Härmed intygar Zyxel att denna utrustning står I överensstämmelse med de väsentliga egenskapskrav och övriga relevanta bestämmelser som framgår av direktiv 2014/53/EU. |
|----------------------|---|
| Norsk                | Erklærer herved Zyxel at dette utstyret er I samsvar med de grunnleggende kravene og andre relevante bestemmelser I   |
| (Norwegian)          | direktiv 2014/53/EU.  |

Notes:

- Although Norway, Switzerland and Liechtenstein are not EU member states, the EU Directive 2014/53/EU has also been implemented in those countries
- The regulatory limits for maximum output power are specified in EIRP. The EIRP level (in dBm) of a device can be calculated by adding the gain of the antenna used (specified in dBi) to the output power available at the connector (specified in dBm).

#### Safety Warnings

- Do not use this product near water, for example, in a wet basement or near a swimming pool.
- Do not expose your Zyxel Device to dampness, dust or corrosive liquids.
- Do not store things on the device.
- Do not obstruct the Zyxel Device ventilation slots as insufficient airflow may harm your Zyxel Device. For example, do not place the Zyxel Device in an enclosed space such as a box or on a very soft surface such as a bed or sofa.
- Do not install or service this Zyxel Device during a thunderstorm. There is a remote risk of electric shock from lightning. Connect ONLY suitable accessories to the Zyxel Device.
- Do not open the Zyxel Device or unit. Opening or removing covers can expose you to dangerous high voltage points or other risks.
- Only qualified service personnel should service or disassemble this Zyxel Device. Please contact your vendor for further information.
- Make sure to connect the cables to the correct ports.
- Place connecting cables carefully so that no one will step on them or stumble over them.
- Always disconnect all cables from this Zyxel Device before servicing or disassembling.
- Do not remove the plug and connect it to a power outlet by itself; always attach the plug to the power adapter first before connecting it to a power outlet.
- Do not allow anything to rest on the power adapter or cord and do NOT place the product where anyone can walk on the power adapter or cord.
- Please use the provided or designated connection cables/power cables/adapters. Connect it to the right supply voltage (for example, 120V AC in North America or 230V AC in Europe). If the power adapter or cord is damaged, it might cause electrocution. Remove it from the Zyxel Device and the power source, repairing the power adapter or cord is prohibited. Contact your local vendor to order a new one.
- The following warning statements apply, where the disconnect device is not incorporated in the Zyzel Device or where the plug on the power supply cord is intended to serve as the disconnect device,
  - For permanently connected Zyxel Device, a readily accessible disconnect device shall be incorporated external to the Zyxel Device;
  - For pluggable devices, the socket-outlet shall be installed near the Zyxel Device and shall be easily accessible.

#### **Environment Statement**

#### ErP (Energy-related Products)

Zyxel products put on the EU and United Kingdom market in compliance with the requirement of the European Parliament and the Council published Directive 2009/125/EC and UK regulation establishing a framework for the setting of ecodesign requirements for energy-related products (recast), so called as "ErP Directive (Energy-related Products directive) as well as ecodesign requirement laid down in applicable implementing measures, power consumption has satisfied regulation requirements which are:

- Network standby power consumption < 8W, and/or
- Off mode power consumption < 0.5W, and/or
- Standby mode power consumption < 0.5W.

(Wireless settings, please refer to the chapter about wireless settings for more detail.)

#### **Disposal and Recycling Information**

The symbol below means that according to local regulations your product and/or its battery shall be disposed of separately from domestic waste. If this product is end of life, take it to a recycling station designated by local authorities. At the time of disposal, the separate collection of your product and/or its battery will help save natural resources and ensure that the environment is sustainable development.

Die folgende Symbol bedeutet, dass Ihr Produkt und/oder seine Batterie gemäß den örtlichen Bestimmungen getrennt vom Hausmüll entsorgt werden muss. Wenden Sie sich an eine Recyclingstation, wenn dieses Produkt das Ende seiner Lebensdauer erreicht hat. Zum Zeitpunkt der Entsorgung wird die getrennte Sammlung von Produkt und/oder seiner Batterie dazu beitragen, natürliche Ressourcen zu sparen und die Umwelt und die menschliche Gesundheit zu schützen.

El símbolo de abajo indica que según las regulaciones locales, su producto y/o su batería deberán depositarse como basura separada de la doméstica. Cuando este producto alcance el final de su vida útil, llévelo a un punto limpio. Cuando llegue el momento de desechar el producto, la recogida por separado éste y/o su batería ayudará a salvar los recursos naturales y a proteger la salud humana y medioambiental.

Le symbole ci-dessous signifie que selon les réglementations locales votre produit et/ou sa batterie doivent être éliminés séparément des ordures ménagères. Lorsque ce produit atteint sa fin de vie, amenez-le à un centre de recyclage. Au moment de la mise au rebut, la collecte séparée de votre produit et/ou de sa batterie aidera à économiser les ressources naturelles et protéger l'environnement et la santé humaine.

Il simbolo sotto significa che secondo i regolamenti locali il vostro prodotto e/o batteria deve essere smaltito separatamente dai rifiuti domestici. Quando questo prodotto raggiunge la fine della vita di servizio portarlo a una stazione di riciclaggio. Al momento dello smaltimento, la raccolta separata del vostro prodotto e/o della sua batteria aiuta a risparmiare risorse naturali e a proteggere l'ambiente e la salute umana.

Symbolen innebär att enligt lokal lagstiftning ska produkten och/eller dess batteri kastas separat från hushållsavfallet. När den här produkten når slutet av sin livslängd ska du ta den till en återvinningsstation. Vid tiden för kasseringen bidrar du till en bättre miljö och mänsklig hälsa genom att göra dig av med den på ett återvinningsställe.

以下訊息僅適用於產品具有無線功能且銷售至台灣地區:

- 第十二條 經型式認證合格之低功率射頻電機,非經許可,公司,商號或使用者均不得擅自變更頻率、加大功率或變更原設計之特性及功能。
- 第十四條低功率射頻電機之使用不得影響飛航安全及干擾合法通信;經發現有干擾現象時.應立即停用.並改善至無干擾時方得繼續使用。 前項合法通信.指依電信法規定作業之無線電通信。低功率射頻電機須忍受合法通信或工業、科學及醫療用電波輻射性電機設備之干擾。
- 無線資訊傳輸設備忍受合法通信之干擾且不得干擾合法通信;如造成干擾,應立即停用,俟無干擾之處,始得繼續使用。
- 無線資訊傳輸設備的製造廠商應確保頻率穩定性,如依製造廠商使用手冊上所述正常操作,發射的信號應維持於操作頻帶中
- 使用無線產品時,應避免影響附近雷達系統之操作。
- 高增益指向性天線只得應用於固定式點對點系統。

以下訊息僅適用於產品屬於專業安裝並銷售至台灣地區:

• 本器材須經專業工程人員安裝及設定,始得設置使用,且不得直接販售給一般消費者。

安全警告 - 為了您的安全, 請先閱讀以下警告及指示:

- 請勿將此產品接近水、火焰或放置在高溫的環境。
- 避免設備接觸:
- 任何液體 切勿讓設備接觸水、雨水、高濕度、污水腐蝕性的液體或其他水份。
- 灰塵及污物 切勿接觸灰塵、污物、沙土、食物或其他不合適的材料。
- · 雷雨天氣時,不要安裝或維修此設備。有遭受電擊的風險。
- 切勿重摔或撞擊設備,並勿使用不正確的電源變壓器。

NR/FWA Indoor Series User's Guide

- 若接上不正確的電源變壓器會有爆炸的風險。
- 請勿隨意更換產品內的電池。
- 如果更換不正確之電池型式,會有爆炸的風險,請依製造商說明書處理使用過之電池。
- 請將廢電池丟棄在適當的電器或電子設備回收處。
- 請勿將設備解體。
- 請勿阻礙設備的散熱孔,空氣對流不足將會造成設備損害。
- 請使用隨貨提供或指定的連接線/電源線/電源變壓器·將其連接到合適的供應電壓(如:台灣供應電壓110伏特)。
- 假若電源變壓器或電源變壓器的纜線損壞,請從插座拔除,若您還繼續插電使用,會有觸電死亡的風險。
- 請勿試圖修理電源變壓器或電源變壓器的纜線,若有毀損,請直接聯絡您購買的店家,購買一個新的電源變壓器。
- 請勿將此設備安裝於室外,此設備僅適合放置於室內。
- 請勿隨一般垃圾丟棄。
- 請參閱產品背貼上的設備額定功率。
- 請參考產品型錄或是彩盒上的作業溫度。
- 產品沒有斷電裝置或者採用電源線的插頭視為斷電裝置的一部分,以下警語將適用:
  - 對永久連接之設備·在設備外部須安裝可觸及之斷電裝置;
  - 對插接式之設備,插座必須接近安裝之地點而且是易於觸及的。

#### About the Symbols

Various symbols are used in this product to ensure correct usage, to prevent danger to the user and others, and to prevent property damage. The meaning of these symbols are described below. It is important that you read these descriptions thoroughly and fully understand the contents.

#### **Explanation of the Symbols**

| SYMBOL      | EXPLANATION   |
|-------------|---|
| $\sim$      | Alternating current (AC):<br>AC is an electric current in which the flow of electric charge periodically reverses direction.                                      |
|             | Direct current (DC):<br>DC if the unidirectional flow or movement of electric charge carriers.  |
| $\triangle$ | Earth; ground:<br>A wiring terminal intended for connection of a Protective Earthing Conductor.   |
|             | Class II equipment:<br>The method of protection against electric shock in the case of class II equipment is either double insulation or<br>reinforced insulation. |

#### Viewing Certifications

Go to http://www.zyxel.com to view this product's documentation and certifications.

#### **Zyxel Limited Warranty**

Zyxel warrants to the original end user (purchaser) that this product is free from any defects in material or workmanship for a specific period (the Warranty Period) from the date of purchase. The Warranty Period varies by region. Check with your vendor and/or the authorized Zyxel local distributor for details about the Warranty Period of this product. During the warranty period, and upon proof of purchase, should the product have indications of failure due to faulty workmanship and/or materials, Zyxel will, at its discretion, repair or replace the defective products or components without charge for either parts or labor, and to whatever extent it shall deem necessary to restore the product of equal or higher value, and will be solely at the discretion of Zyxel. This warranty shall not apply if the product has been modified, misused, tampered with, damaged by an act of God, or subjected to abnormal working conditions.

#### Note

Repair or replacement, as provided under this warranty, is the exclusive remedy of the purchaser. This warranty is in lieu of all other warranties, express or implied, including any implied warranty of merchantability or fitness for a particular use or purpose. Zyxel shall in no event be held liable for indirect or consequential damages of any kind to the purchaser.

To obtain the services of this warranty, contact your vendor. You may also refer to the warranty policy for the region in which you bought the Zyxel Device at https://www.zyxel.com/global/en/support/warranty-information.

#### Registration

Register your product online at www.zyxel.com to receive email notices of firmware upgrades and related information.

#### **Open Source Licenses**

This product may contain in part some free software distributed under GPL license terms and/or GPL-like licenses. To request the source code covered under these licenses please go to:
